THORBURNS SEEDS 1915

J.M.THORBURN & CO.
53 BARCLAY STREET THROUGH TO 54 PARK PLACE
NEW YORK CITY

The Improvement of Land

THE correct preparation of land so as to insure maximum crops is a weighty problem with most farmers and gardeners, if we can judge from the number of requests that come in daily for information on this subject.

To prepare old worn-out soils that have been allowed to get into a hard, poor, weedy condition, for a Vegetable-Garden, it is necessary to get the soil mellow, well enriched with decayed vegetable matter and well-rotted barnyard manure, and clear of weeds.

The ground should be plowed as early in spring as it can be worked, putting in about one ton of burnt lime to the acre. Harrow and pulverize, giving the soil a thorough working to get it as fine as possible. Sow $1\frac{1}{2}$ bushels Canadian field peas and 3 bushels oats to the acre. Late in June or early in July this crop should be plowed under, applying thirty or forty loads of coarse, well-rotted barnyard manure, well worked in, and sow 2 bushels of buckwheat and rye and 20 lbs. crimson clover to the acre, or $2\frac{1}{2}$ bushels cowpeas to the acre. If buckwheat, rye and clover are used, let the buckwheat die down when frost comes and plow all under early next spring—if cowpeas are sown, turn them under in September and apply a ton of unleached hardwood ashes to the acre and sow 2 bushels rye to the acre, and in spring apply another thirty or forty loads of well-rotted barnyard manure, plowing under as soon as dry enough.

In place of sowing in July, the cereals mentioned above, the oats and peas may be followed with white beans, planted in hills, cultivated both ways and hoed. In September sow rye among the beans and in spring plow all under; another half ton of lime can be used to advantage, and the cultivating and hoeing will clean out the weeds and give a cleaner garden. This soil, if thoroughly plowed and harrowed, should be mellow and rich enough to grow any kind of vegetables.

Another plan would be to plow the ground as deeply as possible in fall. Harrow and pulverize, to make it friable and easy to work. Apply as a top dressing 50 bushels air-slaked lime and sow to rye, 2 bushels to the acre. Apply thirty or forty loads of coarse barnyard manure early in spring, and plow all under about the middle of June, then sow cowpeas, 2½ bushels to the acre, and harrow or cultivate them in. About the end of September turn the cowpeas under, applying one ton of unleached hardwood ashes and again sow to rye. Next spring apply forty loads of well-rotted barnyard manure and plow all under as soon as dry enough.

In order to renovate ground used as a Vegetable Garden that has been run down, as soon as frost comes the ground should be plowed applying a liberal quantity of well-rotted barnyard manure, working it well in, then sow winter rye, 2 bushels to the acre. In early spring this should be plowed well under, applying Thorburn's Complete Manure at the rate of 1200 to 1500 lbs. per acre—this will give a good foundation for the new garden.

J. M. THORBURN & CO.

Well into the SECOND CENTURY in the business of supplying to all interested in gardening, the finest and most choice quality of SEEDS, BULBS, ROOTS, etc., obtainable in the world, the House of THORBURN continues to retain the confidence and friendship of its old customers, besides gaining annually many thousands of new friends from among the largely increasing numbers of both amateur and professional gardeners.

HIS, our 114th successive Annual Catalogue, will be found replete with lists of SEEDS, BULBS, etc., all of the HIGHEST GRADE only, as well as miscellaneous articles necessary for the successful cultivation and care of the garden. You can make up your order from its pages with entire confidence in the exceptional quality of the products we are offering.

Our catalogues have always received a considerable amount of study. The cultural directions and descriptions in them are concise

and to the point.

Over a century in business means something—and it does much to emphasize the reliability of our goods. The Thorburn experience—the Thorburn knowledge of what's what in seeds—the Thorburn reputation

for fair dealing—these are your safeguards in buying.

We would suggest that your order be made up as soon after the receipt of this catalogue as possible. It will help us to ship promptly, and it will help you by giving you your goods just when you want them. Placing orders late sometimes makes delays unavoidable. But we have the facilities for handling a vast amount of business, and your orders will receive the most prompt attention regardless of when they come.

If there is any information you want that is not given in this catalogue, write us about it. We will give all inquiries our careful attention.

May we have the pleasure of filling your order?

WE ASK THAT YOU READ THE NEXT PAGE BEFORE SENDING IN YOUR ORDER

CULTURAL DIRECTIONS

These apply to the climate of New York and vicinity. For more northern and southern localities the necessary changes in time of sowing, etc., will readily suggest themselves to gardeners.

ORDERS

Orders should be written on our order sheet or on a blank sheet separate from letter, preferably in ink, and, to receive prompt attention, should be directed to the firm and not to individuals. Orders from new customers should be accompanied by a remittance in the form of a Post-Office or Express Money Order, Bank Check or Bank Bills.

PRICES

The prices quoted are net, and do NOT include free transit, EXCEPT FOR SEEDS PACKETS, OUNCES or QUARTER-POUNDS, on which WE pay postage or expressage anywhere in the U.S.

SEEDS BY MAIL OR EXPRESS

If wanted by mail in the United States, add postage according to zone rate, as per table at foot; and 12 cents per pound in Canada, except for seeds ordered by the packet, ounce or 1/4lb., which we mail free. By special arrangement with the express companies, we can ship seeds and bulbs at a reduction of 20 to 25 per cent from the regular rates. In view of the greater safety, it will be found best to send parcels of 15 lbs. or over by express, as packages are apt to get crushed in the mail. Unless otherwise instructed, we send orders from persons unknown to us C. O. D.

It sometimes happens that certain articles are not ready when the bulk of the goods ordered is shipped. In such cases, rather than hold back the whole order, we send what is ready and keep a memorandum of what is to follow when available. Customers would, therefore, in such cases, do well to await our advice or invoices before writing in regard to items not sent them.

NAME, ADDRESS, ETC.

We beg our correspondents to give us on each order the correct name and address; also to indicate very precisely the means of carriage which they prefer-mail, express or freight, and the office or railroad station which best serves their locality. In case these directions are not followed out, or if they are not sufficient, we ourselves shall of course choose the most advantageous and convenient means.

WARRANTIES

Seeds of best quality will sometimes fail through improper treatment. Thus, a small seed may be sown so deeply that the young plant cannot reach the surface. More failures result from disregard of the conditions necessary to germination than from inferiority of the seeds used.

These conditions are: A proper temperature, sufficient moisture and free access of air. Besides these, the soil must be in proper condition and present no physical obstacle to the growth of the young plant. If heavy rains have compacted the surface of the soil, and the sun has baked it to a hard crust, it will be impossible, even if all other conditions are favorable, for the seedling plants to force their way through it, and many perish from this cause alone.

Seeds differ greatly as to the temperature required for germination. Beets, cress, peas, etc., germinate rapidly at a temperature of 45°; but if melons and other seeds of that family, bush or pole beans, and other plants of subtropical origin, are sown under the same conditions, they will be apt to decay, as for their prompt germination they require a heat of at least 60°. For this reason many seeds fail yearly from too early sowing.

The second condition, proper moisture, is likely to be violated by an excess rather than by too small a portion. The proper amount is that which a well-drained soil will naturally hold.

Free access of air is all-important, and this is interfered with by an excess of water in the soil.

In germination complex chemical changes take place in the seeds, in which the air performs an important part. A portion of the seed is consumed, carbonic acid gas being given off in changing the starch and other constituents of the seed into nutriment to forward the growth of the germ or embryo plant, which depends upon the contents of the seed until it forms roots below ground and leaves above, and is able to sustain itself.

Besides these conditions affecting the germination of the seed, the young plants, after they have made their way to the surface, are liable to various accidents; a sudden current of very cold air, or a continuous drying wind may check their growth or destroy them altogether.

In addition, there are numerous insects, both below and above ground, that may attack the plants, some of them being so small that they often destroy a crop before they are discovered.

We may also mention the well-known tendency of many vegetables to revert to their original types, notwithstanding the care of the seed-grower; the yellow-podded wax beans becoming green, the yellow and white celery becoming more or less green, dwarf peas becoming running sorts, etc.

J. M. Thorburn & Co. give no warranty, express or implied, as to description, quality, productiveness or any other matter of any seeds, bulbs or plants they send out, and they will not be in any way responsible for the crop. If the purchaser does not accept the goods on these terms, they are at once to be returned.

Directions for the Cultivation of Vegetables

O SECURE a good crop of vegetables, three things are necessary, viz., a suitable soil, pure seed and clean culture. The exposure for a vegetable-garden should be south or southeast, or nearly so. The soil should be naturally rich and friable, a sandy loam being about the best. If the soil be stiff, it should be gradually mellowed by the free use of barnyard manure, or, if convenient, by the addition of sand. If wet, or inclined to hold an excess of moisture, it should be underdrained, preferably by tile; but, if possible, a location should be selected naturally dry and free from surface water.

A dark-colored soil, or one supplied with a goodly portion of decayed vegetable matter, will produce the earliest crops. If the soil be shallow, it should be deepened gradually by plowing or spading an inch or two deeper each year, and not all at once by trenching or subsoiling, unless manure and money both be abundant. A sandy soil may be greatly improved by adding vegetable mold from the woods. To produce the best results, the vegetable-garden should have at least one foot of good, rich soil. The roots of large trees should not be allowed to encroach on any part of the garden, though large trees, sufficiently

PORTION OF OUR TRIAL-GROUNDS

far off, afford a valuable protection on the north and west.

Mark the garden off into squares or beds of convenient size, to facilitate the practice of a rotation of crops, which is an important matter. As a rule, never let the same crop or kind of vegetable occupy the same bed or spot two years in succession. Potatoes, Onions and a few other things may form exceptions to this rule. Every year the beds must be warmed up by a liberal coat of manure, which should be thoroughly mixed with the soil. From seeds sown in drills, larger crops from a given surface are grown, and cultivation is simple and comparatively easy. The space between the drills, and other special information, is given in the body of this catalogue; the least distance is named, in order to economize space; it might be increased in some cases to advantage. The ground should be frequently hoed, to kill the weeds and to keep the soil mellow; and the proper time to hoe is just when the weeds appear above the ground.

Much time may be gained by starting certain kinds of plants in a hotbed, or even in a coldframe, the latter being a convenient thing, even on a small place. The hotbed is chiefly intended for raising early Tomatoes, Eggplants, Peppers, Cabbage, Cauliflower, Lettuce, etc., but as all these plants can now be bought cheaply of this company at the proper time, the expense and labor of a hotbed may be dispensed with,

especially on small places.

To prepare a coldframe.—The coldframe is

simply a frame set on the ground, no bottom heat being applied. It is banked up on the outside during the winter with salt hay, straw or coarse litter. The soil is prepared by forking in and thoroughly mixing to the depth of 10 to 12 inches a liberal quantity of old, well-rotted manure. The manure of an old hotbed is good for the purpose. The frame is prepared in the fall, and young Cabbage, Cauliflower and Lettuce plants are set out in it in time to get well established before very cold weather. Cauliflower and Cabbage should be set down to the first leaf, and the soil made firm around the plants. The seed is usually sown, in the vicinity of New York, from the 15th to the 20th of September, but the very early kinds some 8 or 10 days later. The young plants will be ready to transplant in about 25 to 30 days. During the cold nights and stormy days, the beds should be closely covered with the sashes, and these further protected by straw mats or shutters. Cauliflower needs more and closer protection than Cabbage, as it is rather more tender. During mild days admit air freely, the object being to keep the plants in a dormant state, without actual freezing, so that when spring comes they are in a forward state for setting out early crops. Seeds of Cabbage, Cauliflower, Lettuce and Radish may be sown in a coldframe in the spring from the last week in February to the first week in March. The frame should stand in a warm and sheltered spot, and be kept from freezing by mats or a thick covering of straw during cold nights.

Directions for Making a Hotbed

N THE vicinity of New York, from the first to the latter part of March is quite early enough to make a hotbed. The time must vary according to the latitude. Use fresh horse-manure and add to this, if possible, onethird to one-half of its bulk of leaves. Mix them thoroughly, tramping down the mass in successive layers, and form into a large pile, so that fer-

mentation will proceed. In two or three days fermentation will be apparent by the escape of steam from the heap. Now turn again, and allow the heap to remain until the second fermentation commences. Make a pit 21/2 feet deep, and of a size suited to the number of plants required. The pit will be better if built up of brick. It should be located in a dry, sheltered spot, facing the south or east, if possible. Hotbed sashes are usually 3 x 6 feet, and one or two sashes will give early plants enough for a small family. The frame of the bed should be 18 inches high at the back and 12 inches in front, which will give the proper slope to catch the sunlight. Crosspieces should be placed for the sashes to slide on, to facilitate opening and shutting the frames.

When everything is ready, the manure is I all sides than the frame.

placed in the pit and trodden down firmly in layers to the required depth, 2 to 21/2 feet. Then put on the sashes and keep the pit closed until the heat arises. At first it will probably be 100° or more, which is too hot to sow the seed in; but in two or three days it will subside to 90° or a little less, when the soil may be put on to the depth of 6 to 8 inches. Try the heat by plunging a thermometer into the manure.

The soil should be of well-rotted sod (or common garden soil will do), mixed with about a third of fine old manure; and in this the seeds may be sown thinly in drills 2 to 3 inches apart and afterward (as soon as out of the seed-leaf) either thinned out or else transplanted to another frame. Air must be given every mild day by

raising the sashes at the back.

Water with tepid water whenever necessary, and during cold nights and snow-storms keep covered with mats or board shutters. Tomatoes, Peppers and Eggplants should be sown in a separate frame from Cabbage, Cauliflower and Lettuce, as they require more heat.

Hotbeds may be made on the surface of the ground, if the manure extends a foot wider on

Do You Need a Gardener? At all times we have on our books the names of capable men in search of employment on private estates, farms and the like, and all persons in search of help are cordially invited to call upon us at any time for such men. Gardeners and Superintendents desiring positions are requested to call here, or drop us a line for application blanks.

Novelties and Specialties in Vegetable Seeds

Beet, Turnip, "Khedive" EGYPTIAN NEW DARK-LEAVED

In all respects identical with the standard Egyptian Beet, but its foliage is smaller and of a fine, deep red. Pkt. 15 cts.

Beet, New Model Globe

Early and smooth; very dark red; splendid sort. Oz. 15 cts., lb. \$1.25.

Brussels Sprouts, "Hercules"

This fine, new sort is tolerably early, of dwarf habit (scarcely 1½ feet high), of robust and sturdy growth, and with large, round, solid Sprouts, beginning close to the ground. Desirable. Pkt. 10 cts., oz. 40 cts.

Thorburn's Gilt-Edge Cauliflower

Best and surest of all. Produces large, heavy, solid, white heads of finest quality. Undoubtedly the best variety. Pkt. 25 cts., oz. \$2, 1/4lb. \$7.50.

New Early Cabbage, Copenhagen Market

GENUINE DANISH-GROWN SEED

Undoubtedly the finest, large, round-headed early Cabbage. The heads average about ten pounds each in weight, are very solid and of fine quality. It matures as early as Charleston Wakefield, and will give a heavier yield per acre than that well-known variety. The plant is short-stemmed, the leaves light green, rather small, and always tightly folded. The plants, therefore, can be set closer together than is usual with varieties of similar size. Pkt. 10 cts., oz. 35 cts., ½ lb. \$1, lb. \$3.50.

Early Jersey Wakefield Cabbage THORBURN'S SELECTED STOCK

Undoubtedly the finest strain of this most popular, well-known early Cabbage in cultivation. The heads are extremely solid, pyramidal in shape, with very little outside foliage. Pkt. 10 cts., oz. 25 cts., ½ lb. 75 cts., lb. \$2.50.

Extra-Early Nordheim Sweet Corn

The earliest Sweet Corn in cultivation. Produces stalks from 6 to 7 feet high, each bearing three or four nearly perfect ears of finest quality. On style of Minnesota, but far exceeding that variety in the deliciousness of its flavor, as well as in earliness and productiveness. Pt. 25 cts., qt. 40 cts., ½pk. \$1.25, pk. \$1.75.

Golden Evergreen Sweet Corn

Late; very sweet, round grains. Pt. 20 cts., qt. 30 cts., ½pk. 90 cts., pk. \$1.60.

Cucumber, Black Spine

Extra long; prolific; very fine sort. Pkt. 10 cts., oz. 20 cts., 1/4lb. 40 cts., lb. \$1.50.

Cucumber, Thorburn's Noroton Selected White Spine

A selection of the Improved White Spine, but earlier, more perfect in shape and more prolific. The best slicing variety we have seen, being solid in flesh, fine-grained, tender and of delicious flavor. Vigorous, healthy grower. A splendid sort for the home garden, and absolutely without an equal for market. Pkt. 10 cts., oz. 20 cts., 1/41b. 40c., lb. \$1.50.

Delicious Gold-Lined Rocky Ford Cantaloup

Said to be the acme of perfection. Slightly oval; flesh thick, fine-grained and sweet; heavily netted over the entire melon. Pkt. 10 cts., oz. 25 cts., ½lb. 75 cts., lb. \$2.50.

THORBURN'S GILT-EDGE GOLDEN SELF-BLANCHING CELERY

Celery, Thorburn's Gilt-Edge Golden Self-Blanching

Golden Self-blanching is the variety of Celery par excellence, and we can recommend our strain with every confidence. The chief characteristics of this sort are its self-blanching qualities and the beautiful waxy yellow appearance of the stalks. It is or compact, heavy growth and produces stalks that are brittle and crisp in the extreme and hearts that are large and solid. Pkt. 20 cts., oz. \$1.25, 1/4lb. \$4, lb. \$15.

Thorburn's Big Boston Lettuce, Improved

Our strain of this well-known and most popular sort is without doubt the finest in existence. It is too well known to require any lengthy description. It is sufficient to say that it is equally valuable for growing in greenhouses for winter use, in frames for spring, or for sowing the seed in the open ground for use in summer and fall. It is unequaled by any other variety for crispness and tenderness; produces large, solid heads with few outside leaves, and stands long before running to seed. See illustration of a head of Big Boston Lettuce, Improved, on page 28. Pkt. 5 cts., oz. 15 cts., ½ lb. 35 cts., lb. \$1.25.

New Orchid Lettuce

The famous Orchid Salad used in many of the highest-class restaurants of New York. Golden yellow leaves with brown-red spots; solid and tender; the center leaves, just before making a head, strongly resemble orchid flowers on account of their coloring and formation. Should be cut as the orchid center develops, that is, when the plants have attained about one-quarter of their full growth. Pkt. 10 cts., oz. 40 cts., 1/41b. \$1.25, lb. \$4.

Onion, Marvel of Pompeii

A small white Italian sort, two weeks earlier than Barletta. Pkt. 5 cts., oz. 15 cts., ¼lb. 35 cts., lb. \$1.25.

Gradus Pea

Finest of all extra-early sorts; pods very large and well filled with large, wrinkled, deep green Peas of the finest quality. Pt. 20 cts., qt. 35 cts., ½pk. \$1.25, pk. \$2.

Thomas Laxton Pea

A cross between Gradus and another extra-early sort. Very early and very productive; the pods are large and contain seven or eight large, wrinkled Peas of the finest quality. Pt. 20 cts., qt. 35 cts., ½pk. \$1.25, pk. \$2.

Te Aroha, or Good Luck Pea

Fine, dark green foliage; large pods; Peas of superb flavor. Pt. 25 cts., qt. 40 cts., ½pk. \$1.35, pk. \$2.25.

Thorburn's Improved Terra-Cotta Tomato

An improvement on this very valuable sort introduced by us a number of years ago. It is quite distinct as to color, the pronounced terra-cotta being carried through almost to the very heart of the fruit. It is of delightfully tender flesh with almost no core and nearly free from acidity. It produces medium-sized Tomatoes, solid and firm, particularly desirable for slicing. A very handsome sort. Pkt. 10 cts., oz. 30 cts., ½1b. 85 cts., lb. \$3.

NAPOLEON TOMATO. ACTUAL SIZE

Tomato, "Napoleon"

A valuable new variety, growing in bunches like grapes; very prolific, each plant producing 100 to 150 Tomatoes of very best quality; color bright scarlet. (See illustration, actual size.) Pkt. 25 cts.

WE ARE IMPORTING French Globe Artichoke Roots

Large, extra-strong roots of the green incurved variety, with a section of the parent stem attached. These "suckers" are taken from selected plants, insuring a high-grade product, which cannot be had from the ordinary seedling stock. 25 cts. each, \$2.50 per doz.

Flower Seed Novelties and Specialties of Merit

Elegance Aster (hA)

In Splendid Mixture

The first really beautiful single Aster. The growth is vigorous and the habit quite pyramidal. The flowers have very long, elegantly waved petals, and a very small yellow center only; each borne on a long, firm stem. It is astonishingly floriferous, and is extremely valuable either for bedding or for cutflowers. The flowers last in water one to two weeks. Pkt. 15 cts.

Aster, Single Japanese (hA)

This Aster is of a branching habit, which is greatly in its favor as a cut-flower, it having a fine, long stem. The central disc of the flower is encircled by a wreath of long, quilled ray petals either white or delicate rose.

White, pkt. 20 cts.

Delicate Rose, pkt. 20 cts.

Aster perennis hybridus semiplenus (hP)

Semi-double Michaelmas Daisies or Hardy Asters

A fine new strain of semi-double varieties of this popular flower. It contains a mixture of beautiful shades. Pkt. 25 cts.

Aster, Giant "Maiden's Blush"

A beautiful light salmon-pink; extra-large, full-double flowers. The plant is of branching habit, about 18 inches in height and very free-flowering. A fine market flower. Pkt. 20 cts.

Alyssum Benthamii compacta

Dwarf, compact, upright growth, with yellowish flowers; useful for carpet-bedding or ribboning. Pkt. 20 cts.

ANTIRRHINUM NANUM GRANDIFLORUM, "MAUVE BEAUTY"

Antirrhinum nanum grandiflorum, "Mauve Beauty"

A unique color in Antirrhinums and quite a new break. The color is a lovely shade of pale clear mauve; the flowers are large and the habit of the plant all that can be desired. A welcome addition to the Nanum type. Pkt. 20 cts.

CALLIOPSIS RADIATA, "TIGER STAR"

Calliopsis radiata, "Tiger Star" (hA)

A rich and continuously blooming annual, with peculiarly colored dark brown and golden yellow tigered flowers, the petals of which are curiously twisted like the cactus dahlia. Of easy culture, growing in ordinary garden soil, and producing its strikingly colored flowers in great abundance all summer. Grows 8 inches high and forms a round, compact bush. The unique form and coloring of the flowers will appeal to those who like oddities. Pkt. 15 cts.

DELPHINIUM PAULI

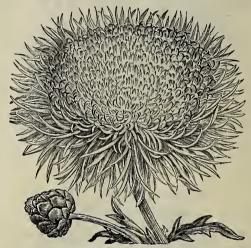

New Cardinal Climber (hA)

(Ipomoea Quamoclit hybrida)

This beautiful annual is the result of a cross between *Ipomæa coccinea* and the Cypress Vine (*Ipomæa Quamoclit*). It is one of the best introductions as regards an annual climber for many years. It is a strong and rapid grower, attaining a height of from 20 to 30 feet, and is of a branching habit. It flowers perpetually from July until frost, the foliage is deeply laciniated, and the flowers are borne in clusters of five to seven, and are of a fiery cardinal-red. It is well worth trying. Pkt. 25 cts.

Centaurea moschata rosea (hA)

This new, beautiful annual Sweet Sultan is 2½ to 3 feet high, with flowers of a very delicate rosy white, and light pink stamens and style; the flowers are about the same size as the white and purple varieties, and will make fine flowers for cutting. Pkt. 25 cts.

CENTAUREA MOSCHATA ROSEA

Cosmos, White Lady Lenox

An exact counterpart in every particular, except as to color, of the favorite Pink Lady Lenox Cosmos. Well worth a trial by all lovers of these splendid annuals. Pkt. 25 cts.

Delphinium chinense grandiflorum violaceum rubrum (hP)

This strain of Delphinium (*D. chinense*) has had only two colors up to this time, viz. blue and white. We offer a new color—violet-red. The flowers are large, and form in clusters on fine, long stems; the plant attains a height of 3 feet, and should gain the favor of many owners of gardens. Pkt. 25 cts.

Delphinium Pauli

A new perennial hardy Larkspur from East Africa. The plants form loosely branched bushes, 1½ to 2 feet in height, with wire-like, stiff stems and branches bearing pure white flowers, 1½ to 1¾ inches in diameter, with spurs of equal length; the stamens are dark violet-brown. A feature of this new Delphinium is the intense, sweet, eucharis-like scent of the flowers. Pkt. 20 cts.

DIMORPHOTHECA AURANTIACA HYBRIDA FL. PL.

Dimorphotheca aurantiaca hybrida fl. pl. (hA)

Double-Flowering African Daisy

This is the double and semi-double form of the African Golden Daisy hybrids which we offered last season. As the single form gave such entire satisfaction, we feel sure that this novelty will do likewise. Pkt. 25 cts.

Eryngium hybridum spectabile (hP)

This beautiful strain of "Silver Thistle" is a great improvement on the *Eryngium giganteum*, being of far more vigorous growth. This hybrid has some beautiful colors in it, ranging from ivorywhite to light lilac, sky-blue and deep violet. The quaint, bizarre flowers are most interesting, and everyone who fancies perennial plants should try this. Pkt. 25 cts.

Gazania longiscapa

A magnificent annual from South Africa. Forms round bushes about 8 inches in height, with dark green foliage, and covered with large, long-stemmed flowers of a lovely golden yellow with unique brown markings. Blooms continuously all through the season; of the easiest culture; succeeds best in a sunny location. Pkt. 25 cts.

Gypsophila paniculata flore pleno

By repeated artificial crossing of the double-flowering variety and the single-flowering type, seeds of this handsome perennial have been obtained which produce about 50 per cent of double-flowering plants. The flowers are of the purest white, and are indispensable for bouquets and vases. Pkt. 50 cts.

Leucanthemum praecox, "White Lady"

This new, hardy white Marguerite is a very showy perennial; about 60 per cent of semi-double flowers will be produced from seed. Excellent for cutting. Pkt. 25 cts.

Leucanthemum secundum giganteum Giant Shasta Daisy (hP)

This strain has flowers which measure 4 to 5 inches across, borne on strong stems, 2 to 3 feet high; the discs of this beautiful Daisy are very small, of a deep golden yellow, surrounded with extremely long florets of snow-white. Pkt. 25 cts.

Lupinus polyphyllus Moerheimii

A perennial plant that everyone should have

This New Perennial Lupin is of rather dwarf habit, with beautiful rose-and-white flowers, and blooms continuously during the summer. Pkt. 25 cts-

PLANT OF GAZANIA LONGISCAPA

Myosotis alpestris elegantissima coerulea flore pleno (hP)

Double Blue Forget-me-not

A new double-flowered variety of the blue pyramidal Alpine Forget-me-not, coming nearly true from seed. Height of the plant, 8 to 9 inches. The double flowers preserve their freshness for a long time. Pkt. 25 cts.

Nasturtium Lobbianum, Ivy-Leaved, "Emma Alida"

Dark, ivy-leaf-shaped foliage, with golden yellow and orange to deep scarlet, laciniated flowers; very lively colors. Pkt. 15 cts.

Virginia Poppy (hA)

Papaver somniferum

This new, large-flowering, single Poppy produces beautiful, large, white flowers with fringed, soft pink edges. They are especially recommended for cutflowers, for they last long in vases, especially when cut in the morning before they are full blown. Pkt. 15 cts., 2 pkts. 25 cts.

Snapdragon, Majus nanum, Rembrandt

Rembrandt is a quite new addition to this popular flower. It makes a fine spike, bearing flowers of a fiery scarlet, with white throats; the underlip is in three parts and each shows a distinct, sharply bordered, golden yellow spot. Pkt. 25 cts.

Sunflower, Miniature, "Golden Fleece"

The cactus-shaped flowers of this variety are of a clear golden yellow with a dark center; the height of the plant is about 3 to $3\frac{1}{2}$ feet, with long stems; excellent for cutting. Pkt. 15 cts.

VERBENA GRANDIFLORA, "HELEN WILLMOTT"

Verbena grandiflora, "Helen Willmott"

A very pretty, bright salmon-rose, with white eye. The seed produces plants with flowers many of which are of the true "Helen Willmott" color, with a percentage of varied shades, which are also very fine both in color and size. Pkt. 25 cts.

Zinnia, Double Mammoth-Flowering (hA)

A new and distinct class of this ever-popular flower, producing large, very double blooms, from 4½ to 6 inches in diameter. We offer five distinct colors, viz., Crimson, Flesh-color, Sulphur-Yellow, Violet and White. Each color and mixed, pkt. 15 cts. Collection of five varieties, one pkt. of each color, 60 cts.

Dahlia Roots

A fine selection of all sorts mixed, from our trial-grounds. Extra-strong Clumps, 20 cts. each, \$2 per doz.

Japan Iris

Mixed. From a superb collection of largeflowered sorts. 15 cts. each, \$1.50 per doz., \$11 per 100.

Collections of Vegetable Seeds

Only the choicest sorts are put into these assortments, and they are picked out so as to give a continuous supply of vegetables from your garden all season.

The amount charged for these collections is considerably less than you would pay for the individual

seeds, on account of the fact that we are able to put them up during the slack winter months.

Owing to this, we cannot permit any alterations in the varieties, and the reduced price will not be allowed unless the collection is taken in full and without change.

COLLECTION NO. A, \$1 (Including free)

This collection was gotten up primarily for rather small gardens, such as back-yard gardens and the like.

COLLECTIONS OF VEGETABLE SEEDS, continued

COLLECTION NO. 4, \$19 (Including free delivery by express)

If your needs require quite a quantity of fresh vegetables, and you have around three acres that you wish made into a garden, you could not do better than to buy this collection. There are quite a number of private estates and farms that are now doing away with the trouble of going through lengthy lists of vegetables suitable to their needs, and are leaving the matter to our judgment. This collection represents our recommendation as to just what should be used, with the exact quantities for planting approximately three acres, and getting the most out of the land.

ARTICHOKE

ARTICHAUT

Alcachofa

Artischocke

CULTURE.-Deep, rich, sandy loam with plenty of well-rotted manure. Sow seeds in April or May, and when collinks.—Deep, fich, sandy loam with pienty of well-rotted manure. Sow seeds in April of May, and when plants are large enough, transplant into rows 3 to 4 feet apart and 2 feet in the rows. They reach maturity the second year. When cold weather sets in, bank the earth to the top, first cutting off and tying up the leaves so that they will occupy less space, and in the spring fork in a dressing of manure. Artichoke may also be treated as an annual by sowing the seed in hotbeds during February and transplanting in May. The heads should be cut off and used as they get ready. If left to ripen on the plant, they will exhaust it, and no more will be produced that season. Heads are unfit for culinary purposes after the flowers expand.

COLOSSAL ASPARAGUS

French Green Globe. (Seed.) The standard sort. pkt. 10c...110 \$0 40 \$1 25 \$4 50 French Mammoth Laon......pkt. 10c...130 50 1 50 5 00 Jerusalem Artichoke Roots. Qt. 25 cts. FRENCH GLOBE ARTICHOKE ROOTS. (Ready in April.) Extra-

large, strong roots, from selected plants, -not seedling plants, which rarely come true. 25 cts. each, \$2.50 per doz.

ASPARAGUS

Esparrago

CULTURE.—Sow the seed thinly in rows 1 foot apart in April or May (4 or 5 lbs. to the acre), and keep down all weeds. To secure strong, healthy plants, thin the seedlings to 3 or 4 inches in the rows, saving only the strongest. The one-year-old plants should be set out in spring in rich, sandy loam, dug 18 inches deep, into which has been worked plenty of well-rotted manure. If a stiff clay soil is all that can be had, add plenty of sand and sifted coal-ashes to loosen it up, and also see that it is well underdrained. In planting for private use, set out in beds 5 feet wide, three rows in a bed, the outer being each 1 foot from the edge, and allow 18 inches between the rows; set the plants from 4 to 6 inches below the surface. If set out in autumn, top-dress with 6 inches of manure. For market, on a large scale, set out 4 by 1½ feet. Every fall apply a good dressing of coarse manure, after the tops have been cut, and in spring fork in. Never cut too closely. The roots need the benefit of some foliage during the year, else they will weaken and die. Slugs are easily destroyed by applying air-slaked lime or paris green. Asparagus from seed does not always come true to name. come true to name.

In France a business is now made of growing small, green, delicate shoots of Asparagus during the winter. Strong roots may be forced in hotbeds out-of-doors. They should be packed closely into the frames, and by making a new bed every five or six weeks these tiny shoots may be had all winter and are valuable served with omelets, green peas, etc.

BORAGE

BOURRACHE

Borraja

Borretsch

The young leaves of this annual, which smell somewhat like a cucumber, are used as a salad, or boiled like spinach. Should be sown at intervals, as the leaves are palatable only when young. Sow in the spring, in light soil; transplant in shallow drills, a foot apart, when of six weeks' growth. 240. Pkt. 5c., oz. 10c., 1/4 lb. 30c., lb. \$1.

BEANS

As a farinaceous food for man, the Bean is considered far superior to any other legume, and next in importance to wheat. The modern varieties leave little to be desired; the great care given to their improvement has resulted in superior sorts, greatly extending the season of use, as well as varying the flavor.

CULTURE.—About the first of May, if the ground is perfectly warm, select a warm, dry, sheltered spot, dig and manure slightly; make drills 2 inches deep and 18 inches to 2 feet apart; drop the Beans 3 inches apart in the drills, and cover not more than 2 inches deep. Hoe well in dry weather to keep down the weeds. Sow every two weeks for a succession. One quart to 100 feet of drill; one bushel to the acre, in drills.

ENGLISH DWARF BEANS

FEVE DE MARIAS

Haba

Große Bohnen

CULTURE.—Sow in drills 2 feet apart, as early in the spring as the ground can be worked (these are as hardy as peas), in order to get them into pod before the heat of summer. When in pod, break off the top of the plant to check the growth. Plant and hoe the same as for Dwarf Beans. A strong soil suits them best.

DWARF WAX BEANS

We supply packets of all Dwarf Wax Beans at 10 cts. each, postpaid; other quantities NOT prepaid; add transportation charges at the rate of 5 cts. per pint, 10 cts. per quart

Stangen=Bohnen

We supply packets of Pole Beans at 10 cts. each, postpaid; other quantities NOT prepaid; add transportation charges at the rate of 5 cts. per pint, 10 cts. per quart

CULTURE.—Sow as the soil becomes warm and dry, from the first part of May (for all except Limas) to the latter part of May, in hills 4 feet apart each way. Limas should not be planted until warm weather has fairly set in. One quart of Limas will plant about 100 hills, allowing four or five Beans to a hill, and of the smaller sorts, about 200 hills. Poles 8 to 10 feet long should be firmly set in the hills before planting seed.

CULTURE.—Sow as early in the spring as the ground can be worked (one ounce to 50 feet of drill, five or six pounds to the acre), and every two weeks after for a succession up to the first week of July. For general crop, sow about the middle of May. The soil should be light, sandy loam, well enriched with stable manure and plowed and harrowed until very fine. Sow in drills I foot to 15 inches apart, and when well up, thin to from 4 to 6 inches. The young Beets, with their tops, pulled out of the row, are excellent used as a spinach. For this purpose, sow frequently and use when of the size of a hickory nut.

MANGEL-WURZEL AND SUGAR BEET

Runkelrüben

CULTURE.—As all Mangels require a deep soil in order to grow well, plow and subsoil at least 1 foot to 18 inches and apply plenty of rich stable or Thorburn's Complete Manure. Sow in May or June, in rows 18 inches to 2 feet apart, and thin to 8 inches in the rows. Young plants may be transplanted to fill up vacancies. Sow in addition, when the plants are 3 to 4 inches high, at the rate of 200 pounds of Complete Manure, 200 pounds of bone meal and 400 pounds of salt to the acre. As soon as frost occurs, dig the crop. In order to be well preserved for gradual consumption during the winter, Mangel-Wurzels should be heaped to a height of perhaps 6 feet, on a dry, sloping situation; cover at first with a piece of canvas, and, as the cold increases, this should be replaced by about 6 inches of either salt hay, straw, seaweed or cornstalks, with a light layer of earth on top. As soon as this surface soil becomes frozen, about 6 to 8 inches more of earth should be placed over it. By following up this gradual process of covering, all danger of heating will be obviated, and the roots will keep in perfect order. Sow from five to eight pounds to the acre.

BRUSSELS SPROUTS

CHOU DE BRUXELLES

Berza de Brusels

Rosenkohl

CULTURE.—Sow in May, in the same manner as cauliflower, and transplant in July I foot apart in the rows which should be 1½ feet apart. The Brussels Sprout is, without exception, the very best winter vegetable that can be grown. Not the least valuable point connected with it is that it is as hardy as the common, curled greens. The real Sprout is not much larger than a marble, and as firm and hard almost as the stalk itself. Strip off the outer covering, cook them whole, and serve them in that fashion. When cooked through and no more, such Sprouts melt in the mouth like the tenderest cauliflower, and are equally good.

HERCULES. Early; dwarf habit, robust growth, with large, solid Sprouts that are	Oz.	¼lb.	Lb.

BURNET

PIMPERNELLE

Pimpinela

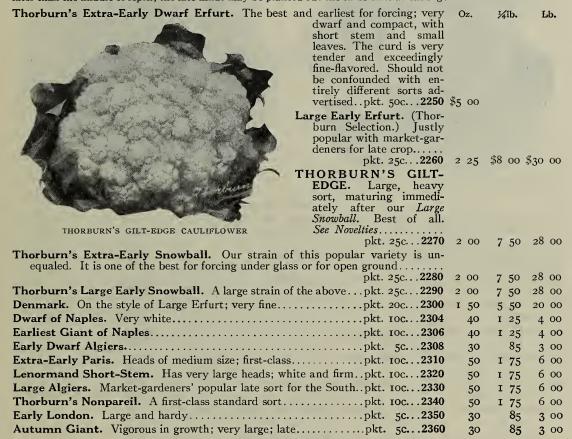

Pimpernelle

CAULIFLOWER

Coliflor

Blumenkohl

CULTURE.—The same as for cabbage, except that extra manure and plenty of water will pay upon Cauliflower. If the soil be dry, water frequently, and, if the plants have a heavy mulch of hay or straw, it will keep the soil moist, and they will not suffer from drought. The early kinds should be strong enough to plant out not later than the middle of April; the late kinds may be planted out the same time as cabbage.

CABBAGE

Снои

Berza de repollo

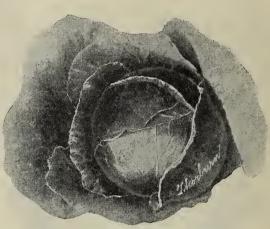

Rohl

Culture.—Soil for Cabbage should be rich and heavy loam, with good drainage. On such a soil, with an abundance of stable or Thorburn's Complete Manure, excellent crops are sure to be grown. For early spring, sow in fall not too early, for the plants are liable to bolt in the spring, instead of heading. In a month the plants will be fit to transplant to coldframes, where they are wintered, taking care in planting to set the young plants down to the first leaves. Transplant in spring as soon as the ground can be worked, setting the plants 2 feet apart one way and from 12 to 18 inches the other, according to the variety. If it is desirable to economize space, lettuce or radish may be sown between the rows, as they will be out of the way before the Cabbage needs the room. For late or winter crop, the seed is sown in May, and the plants set out in July. In this case, they are set in rows 2 by 3 feet, so as to work them with a horse and cultivator. To destroy the green worm, an experienced grower says: "Take one ounce of saltpeter and dissolve it in twelve quarts of water; then take a short-handled whisk-broom, dip it in the solution and sprinkle the plants well. One application is sufficient unless the stuff is washed off by heavy rains. The liquid, being perfectly clear, never colors the cauliflower or Cabbage heads." To prevent the turnip flea attacking the young plants, sift fine air-slaked lime or tobacco dust over them as soon as they appear above ground. above ground.

PARISIAN FORCING CARROTS

CARROT

CAROTTE

Zanahoria

Möhren

Culture.—Sow No. 2890 as early as the ground can be worked; or, for late crop, until the latter part of July, or early in August for a winter crop. This is the finest and most tender for table use. For main crop sow other sorts from middle of May to the first of July. Thin out early crop to 5 inches in the row, main crop, 6 to 7 inches, the rows 10 inches apart for early crop, 14 for main crop. Hoe often and deeply between the rows. Soil should be light and loamy, richly manured and deeply dug. Sow at the rate of two to three pounds to the acre; one ounce to 100 feet of drill. Carrot-tops cut from fairly young plants may be used for pretty indoor greenery. Put one cutting into each thumb-pot, or three or four into a larger pot around the sides. Fairly good and sandy soil should be used, syringing frequently until growth is well forward. About 1 inch of Carrot should be left to put in soil, but this should be surrounded with soil or moss to hide it. When fully grown it is very pretty, the long fronds hanging over gracefully.

CELERY

CELERI

Apios

Gellerie

CULTURE.—Sow the seed in a light, rich, dry border as early as the ground can be worked, in drills 8 to 10 inches apart, and cover the seeds about a quarter of an inch deep, rolling or treading them in if the ground be dry. When fairly out of the seed-leaf, they may be transplanted to another bed, or they may be thinned out to 6 to 8 inches apart, and let grow until wanted to plant out in beds or trenches. The beds should be kept well weeded, and an occasional soaking with water in dry weather will do the plants good. Early in July in the North, a month or six weeks later in the southern states, is the proper time to set the plants out in beds or trenches. Press the soil firmly against the roots. In the garden the better way is to set the plants in shallow trenches. We say shallow for it is obviously a bad plan to remove all the good soil (as must be done in a deep trench) and put the plants in that which is poor. The plants must be set in a single row in a narrow trench; or the trench may be made into a bed wide enough to hold two, three or four rows, and in this case the plants are in a compact form to be covered for the winter where they grow. This will save much labor where there is no root-cellar for storage, as often happens to be the case. When grown in beds in this way, the rows should be I foot apart, and the plants about 8 inches apart in the rows. The bed should be made very rich with thoroughly decomposed manure. The plants will need to be earthed up two or three times, and, in doing this, care should be taken not to let the earth get into the heart of the plant. In field culture, the plants are set on the surface in rows 4 feet apart when the Celery is to be earthed up in the field for early use, and 2 feet apart when the plants are to be taken up and blanched in the cellar for winter use. The plants are set 6 inches apart in rows. If not grown in beds, the best way to store is to dig trenches in a well-drained spot in the open ground, I foot wide, and at a depth of a few inches less than the height of the Celery. The plants are then lifted and set close together. When severe cold weather comes on, cover gradually with leaves hay or straw, and place boards on top. The turnip-rooted Celery (Celeriac) needs no earthing up, and may be planted in rows I foot apart. Early spraying with bordeaux mixture is extremely efficacious in case of

CRESS

Bara o Mastuerzo Rreffe CRESSON

CULTURE.—Sow No. 4520 thickly in shallow drills, every two or three weeks. It should be cut often and it will continue to grow. It is useful not only for salad, but for the breakfast table and for garnishing. Nos. 4550 and 4570 should be sown in damp soil; or, if a stream of water can be utilized, they will be much finer. They will also thrive well in damp hotbeds. Rightly managed, their culture is very profitable. To obtain early salad, it is a good plan to sow with Water Cress seed a strip 4 inches wide on the outer margin of a hotbed, inside the frame, where it is always cool where it is always cool.

CUCUMBER

CONCOMBRE

Pepino

Gurte

CULTURE.—For very early, sow in hotbeds upon pieces of sod, or in small pots. They can be readily transplanted with a gain of about six weeks over those sown in the open ground. Plant out in rich soil when danger of frost is over, or protect by hand-glasses, or by paper held down at the corners with a handful of earth. For general crop, sow in the open ground as soon as the weather is settled and warm, and every two weeks for a succession. For pickles, sow from middle of June to first week in July. Sod land, turned over in fall, is the best for them. Plant in hills 4 feet apart, putting a shovelful of well-rotted manure in each hill.

ENGLISH CUCUMBER FOR FRAMES (Concombre especes (Anglaises pour couches)

CULTURE.—Sow seeds in October, November or December, according to the time they are wanted, in small pots, in fibrous loam, lightened and enriched with old manure; give plenty of air and water. Plunge the pots in a frame near the glass, where there is a little bottom heat, and keep them covered with brown paper until the seeds germinate. Afterward uncover and ventilate to insure sturdiness of habit. Only strong plants should be employed. It is necessary to fertilize the pistillate flowers with the staminate to render the vines productive as, owing to the absence of insects, they will not produce a crop under glass as in open ground.

DANDELION

PISSENLIT Amargon Barbeblume

CULTURE.—Dandelion is a hardy perennial, and one of the most desirable early spring salads. Sow in early spring in drills one-half an inch deep and 18 inches apart; thin out the plants to 12 inches. Keep clear of weeds during the summer, and the ensuing spring the leaves will be fit to cut. They are best, however, when blanched, which makes them tender and destroys, to some extent, their bitter taste without impairing the qualities which make them desirable as greens. The blanching may be done by placing a couple of boards over the rows thus: \(\Lambda \). This excludes the light and improves the greens, rendering them far superior to those found growing wild.

LETTUCE

Salat LAITUE Lechuga

CULTURE.—Sow 6030 and 6230 in hotbeds in March, and in the open ground as soon as it can be worked, and transplant to rows 8 inches apart. Sow in two weeks' time same varieties again for a succession; also Cos sorts. Latter part of August sow any of the varieties. In October some of these may be planted in frames, to head in winter and early spring. Always sow thinly and thin out well, or the plants will not be strong. The last spring sowing had better be grown where sown, being thinned out to 6 to 8 inches apart. Cos Lettuce may be sown in a hotbed early in the year, and transplanted to a coldframe, so as to have good plants to set out at the opening of the ground. Lettuce requires good ground, enriched with thoroughly rotted manure, and well pulopening of the ground. Lettuce requires good ground, enriched with thoroughly rotted manure, and well pulverized. The after culture should be close and careful, to secure the best results. Lettuce seldom, if ever, heads well in hot weather. w. s. stands for white-seeded; b. s. stands for black-seeded

MUSKMELON (Cantaloup)

MELON MUSCADE Melon Muscatel Cantaloup

Culture.—Select a light, rich, sandy soil, and, after all danger of frosts is over and the ground has become warm and dry, plant in hills 4 to 6 feet apart each way, six to twelve seeds to a hill. When up and all danger of insects has passed, pull out all but three plants. Cultivate until the vines cover the ground, and pinch the ends of the growing shoots to induce early fruiting. Ashes, lime, or even dry road-dust, are excellent to sift over young plants when the dew is on, to prevent the attacks of insects. A few hills for early use may be had by sowing in hotbeds, on pieces of sod or in pots. The seed may also be started out-of-doors under hand-frames or glasses. It is quite important that proper soil be selected for growing Muskmelons.

Seta Champignonbrut

CULTURE. - Mushrooms may be grown in cellars, under benches of greenhouses, or in sheds, wherever the temperature of 50 degrees can be kept up through the winter. The up through the winter. The beds should be made from November to February, ac-cording to the time the Mushrooms are wanted, and it requires about two months for requires about two months for them to begin bearing. Secure fresh horse manure, free from straw and litter, and mix an equal bulk of loam from an old pasture with it. Keep this under cover, taking care to turn it every day to prevent heating, until the pile is large enough to make a bed the required size. Three to 4 feet wide, 8 inches deep and any length desired are the proper proportions for a bed, but these length desired are the propor-proportions for a bed, but these may be varied. Prepare the mixture of loam and manure, making the bed in layers, and

making the bed in layers, and pounding down each with the back of the spade. Leave this to heat through for a few days, and as soon as the heat subsides to 90 degrees, make holes in the bed about a foot apart each way, and about one inch deep, into which put pieces of the spawn 2 or 3 inches in diameter; fill up the holes with the compost, and at the expiration of a week or ten days the spawn will have thoroughly diffused itself through the bed. Spread a layer of fresh soil over the heap to the depth of 2 inches and cover with 3 or 4 inches of hay, straw or litter. Examine the bed often to see that it does not get dry. Take special care, however, when water is given, that it be at a temperature of about 100 degrees.

From our experience with English, French and American Spawn, we find there is an important difference between them. If the manure in the bed is in proper condition, the French Spawn will take hold and grow fully as well as the other two; but, if the bed is not in the right state, it will often rot The American and English Spawns, on the contrary, after starting a little, will remain in a comparatively dormant state for a long time without losing

on the contrary, after starting a little, will remain in a comparatively dormant state for a long time without losing their vitality. It is well to keep these points in mind in ordering Spawn.

PEAS

Pois Chicharos o Guisantes Grbien

will be most acceptable. Hoe often and keep the ground clean and fine. The tall sorts can be made to bear more freely by pinching in. The dwarf varieties may be grown in beds like bush beans, with rows about the same distance apart. The holes which are sometimes found in Peas are caused by the Pea weevil (Bruchus pisi). The beetles lay their eggs on the young pods, and the larvæ, as soon as hatched make their way through the pods and into the nearest Peas. If the new aphide attacks the Peas, spray the vines every day with clear water of the same temperature as the atmosphere.

Those marked with a star (*) are wrinkled marrows, and, unless otherwise stated, should be sown thicker than the round Peas and not until the ground has become warm, as they are more liable to rot. They are the finest flavored of all Peas. Those marked thus (†) are large-podded sorts.

podded sorts.

We supply packets of Peas at 10 cts. each, postpaid, except where quoted otherwise; other quantities NOT prepaid. Add transportation charges at the rate of 5 cts. per pint, 10 cts. per quart.

POTATOES, Grown Expressly for Seed BARRELS) POMME DE TERRE Patatas Rartoffeln

CULTURE.—Three to four barrels to the acre. In order to have the best success in growing Potatoes, it is necessary to plant as early as the ground can be made ready. Select a rich soil, and plant in rows 3 feet apart, and the sets 1 foot in the rows. If wood-ashes and plaster can be procured, sow a good dressing over the field after the Potatoes are up. If a very early crop is desired, it will be necessary to sprout the Potatoes before planting. Cut the Potatoes into pieces of any size desirable, and place in a warm, light room for four to six weeks before required for planting in the open ground. During this time shoots will start out strong and vigorous, so that, as soon as planted, they will send out roots and grow much more rapidly than those treated in the ordinary way. Another method is to place the sets in a hotbed two weeks before they are wanted, and then lift carefully and set out on fresh horse dung, so that the heat will cause them to start at once. If the Colorado Potato beetle makes its appearance, the vines must be dusted with paris green mixed with about 80 parts of plaster; or what is better, mix the paris green in water, one small tablespoonful to a pailful, and apply with a small brush or broom. Take care to stir the mixture often, or else the paris green will settle to the bottom. Two or three applications during the season will usually suffice to clean off all the beetles. CULTURE.—Three to four barrels to the acre. In order to have the best success in growing Potatoes, it is

RADISH

RADIS ET RAVE

Rabanos y Rabanitos

Radies und Rettig

CULTURE.—Sow as soon as the ground is dry in the spring, in rows 8 to 12 inches apart, every week or ten days for a succession, up to the middle of June, after which they are but little used, unless a cool northern spot can be had, where the ground is shaded during part of the day. They should be sown in light, rich soil, as a crisp Radish cannot be produced in heavy soils. Sow also in early fall for late crops and winter use. Sow 8 to 10 lbs. to the acre. Radishes should be eaten when quite small; it is a mistake to let them grow too long and too large. This applies particularly to the French Breakfast and small turnip-shaped sorts.

RAMPION

Reponche Rapunzel=Rübe RAIPONCE

CULTURE.—Sow in the open ground early in May, either broadcast or in drills 10 inches apart. As the seed is very fine, it merely requires to be pressed firmly into the soil. Thin out the seedlings if they come up too thickly, and water frequently during hot weather. The roots may be gathered for use from October onward throughout the winter. The roots and leaves are excellent as salad. 11550. Pkt. 10 cts., oz. 20 cts., 1/4 lb. 60 cts., lb. \$2.

ROQUETTE

CULTURE.—Sow early in spring, in rows, and thin out to 8 to 10 inches. If kept well scuffled and watered, the tart flavor of the leaves is greatly diminished. This flavor is not pronounced in the small leaves, which are used for salad. The flowers, appearing from May to June, have very much the odor of orange-blossoms. 11590. Pkt. 5 cts., oz. 10 cts., 10 cts., 11 30 cts., 15.

RHUBARB

CULTURE.—Sow seed in a coldframe, in a fine, rich, sandy loam, about the first of March, in drills 4 inches apart. Keep the frames covered during nights and cold days, so that the soil will not freeze, and in six to eight weeks the plants will be large enough to set in the open ground. Transplant to a rich soil, and set in rows 12 inches apart and 12 inches in the row. The following spring transplant again to a permanent location, setting 4 to 5 feet apart each way. In good soil, Rhubarb is ready to use the second year from seed. When roots are set out plant them 4 to 5 feet apart each way, and keep weeds down. If roots are used, a crop may be had after one season, which is much better than sowing seed where only a few plants for family use are needed. In the fall, the bed should have a thick dressing of coarse manure, to be spaded under in spring. Oz.

SCOLYMUS

The roots resemble a small parsnip, and will keep through the winter like a turnip. It is cultivated exactly like the carrot, except that it should be grown in rows 3 feet apart and 18 inches in the rows. It is eaten boiled like salsify. 11740. Pkt. 10 cts., oz. 25 cts., ½lb. 75 cts., lb. \$2.50.

SCORZONERA

Scorzionwurzel Escorzonera CORZONERE

CULTURE.—Cultivate the same as salsify. It is cooked in the same manner, but, on account of being somewhat more difficult to raise, is seldom seen in cultivation. Considered by many superior to salsify. It is also called Black Salsify. 11780. Pkt. 10 cts., oz. 25 cts., 1/4lb. 75 cts., lb. \$2.50.

SALSIFY, or VEGETABLE OYSTER

Ostion Vegetal Haferwurzel

CULTURE.—Sow as early as the ground can be worked in the spring, in drills 12 inches apart, I inch deep, and thin out to 6 inches in the row. Keep them free from weeds. Cultivate the same as carrots and parsnips. A part of the crop may be left in the ground till spring, when it will be found fresh and plump. The roots are cut into pieces ½ inch long, boiled until tender, and then served with drawn butter, in which way it is a delicious vegetable. They are also mashed and baked like parsnips, and have a sweet and agreeable flavor. Mashed and fried, the flavor is much like that of the oyster. Sow eight to ten pounds to the acre.

Mammoth Sandwich Island. Large. 11850. Pkt. 5 cts., oz., 15 cts., ¼lb. 40 cts., lb. \$1.25.

SKIRRET. See page 41.

SORREL

OSEILLE

Acedera

Sauerampfer

CULTURE.—Sow in spring in drills 18 inches apart, in a rich soil, and keep the flower-stems cut off as they appear. It remains in the ground year after year, and needs to be taken up and divided only once in four or five years. To be cut and cooked precisely like spinach; or it is excellent cooked with it, one-third Sorrel to two-thirds spinach. It is also used for soups. Very nice to be eaten after it has become cool. Inasmuch as the hot sun tends to increase its acidity, a northern exposure is preferable.

GIANT LUCULLUS SWISS CHARD

SWISS CHARD, or SILVER BEET

Silver Leaf. This is a Beet producing leaves only, of a quality superior to those of the ordinary Beet, and excellent as greens.

Cultivate about the same as spinach, by sowing the seed in early spring in drills about a foot apart. As it grows, thin out for use, and keep clear of weeds if success is desired. Good cultivation will increase the delicacy and tenderness of the leaves. 1690. Pkt. 5 cts., oz. 10 cts., ½lb. 25 cts., lb. 75 cts.

Giant Lucullus. Large, crinkled leaves; tender and of fine flavor; dark green; pure white ribs. 1700. Pkt. 5 cts., oz. 15 cts., 110. 40 cts., lb. \$1.25.

SPINACH

EPINARD

Espinaca

Spinat

CULTURE.—Sow in early spring, in drills a foot apart (10 to 12 lbs. to the acre), every two weeks for a succession, and, as it grows, thin out for use. For fall use, sow in August, and for winter crop in September. Cover that which is left out over winter with straw or leaves after the weather becomes quite cold. Keep clear of weeds. Sow the seeds of New Zealand in hills 2 feet apart each way, three or four seeds in a hill.

Tomate

Liebesapfel

CULTURE.—Sow in a hotbed in early spring, or the seed may be sown in shallow boxes and placed in a window when one does not wish to have the trouble of making a hotbed. Transplant to the open ground when all danger of frost is past, setting the plants 3 to 4 feet apart each way. Fruit may be had several weeks earlier by sowing seed quite early and transplanting to small pots. Tomatoes that have not ripened at the end of the season may be taken from the vines and placed in empty coldframes, or wrapped in tissue paper, and carefully packed in flat boxes—where a large proportion of them will ripen from time to time, frequently until Christmas.

WITLOOF. See Chicory, page 24

Rübe NAVET Nabo

CULTURE.—For early Turnips, sow as soon as the ground opens in spring. Nos. 13845 to 13895 should be sown from any time in July to first of August; but the other kinds, for winter use, may be sown from the middle of July to the end of August. Turnips are generally sown broadcast, but much larger crops are obtained (particularly of the Rutabagas) by cultivating in drills 18 inches apart, and thinning to 6 inches in the drill. Sow in drills, one pound to the acre; broadcast, two to three pounds to the acre.

LAWNS LIKE THIS CAN BE PRODUCED BY SOWING THORBURN'S LAWN GRASS SEED

About Lawns and Lawn Grass Seed

FORMATION OF LAWNS FROM SEED

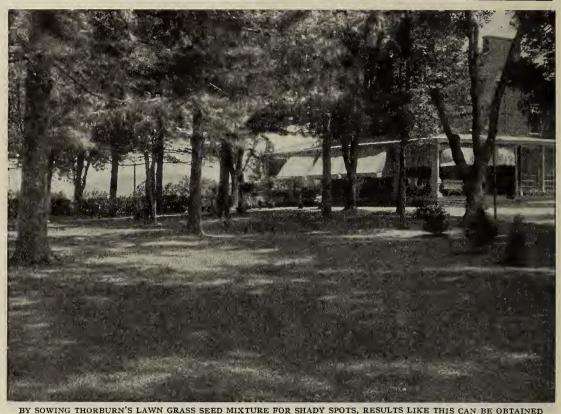

The ground should be thoroughly drained and well prepared. The soil ought not to be too rich, as a rapid growth is not wanted in the grasses of a lawn; but the surface should be as much alike in quality as possible and thoroughly pulverized. After sowing, the ground should be rolled and cross-rolled in order to press the seed firmly into the soil, and ten days or so thereafter a light application of Thorburn's Lawn Fertilizer, mixed with an equal quantity of good loam or sand, will serve to stimulate the growth of the young grasses. The best time to apply this is just before a rain, the idea being to have the fertilizer washed into the roots. The proper time to sow grass seed depends, of course, upon the latitude. In the central and eastern states from March 15 to the middle of May is the best time; but in favorable seasons the sowing may be done up to July 1. Seed may also be sown in the fall, from the latter part of August to the end of September. The sowing should be done when the ground is moist, or before an expected rain, and a subsequent rolling is always advisable. As to weeds in newly made lawns, it may not be generally known that many weed seeds actually lie dormant in the ground for six or seven years and will germinate and make their appearance when the soil is turned up. The annual wild grasses, such as crab grass or summer grass, must be pulled up by the roots before they ripen their seed in the fall. This is the only sure way to rid lawns of these pests.

Rolling.—As soon as the frost is out of the ground in the spring, the land should be gone over with a heavy roller. Winter frosts loosen the soil, and rolling is necessary to compress it again. Roll frequently.

Mowing.—All turf-forming grasses are improved, both in vigor of root-growth and in fineness of texture, by frequent mowings. It is impossible to say just how often the grass should be mown, as that depends upon the rate at which it grows. Too close cutting should be guarded against, however, especially during the hot summer months, when the roots require some top-growth to protect them from the burning sun. A good top-growth is also necessary to protect the roots from severe winter frosts.

To Grass a Bank or a Terrace.—For each square rod, take a pound of Terrace Lawn Grass Seed and mix it thoroughly with 6 cubic feet of good, dry garden loam; place in a tub, and add liquid manure, diluted with about two-thirds of water, so as to bring the whole to the consistency of mortar. The slope must be made perfectly smooth, and then well watered, after which the paste should be applied, making it as even and thin as possible.

It is a good plan to sow on good land, in any out-of-the-way place, strips for sod to be used for patching poor parts of the lawn, or for grass borders, etc. The best mixture of seed for this purpose is Agrostis stolonifera, Cynosurus cristatus and Poa pratensis.

Lawn Grass Seed Mixtures

THE THORBURN LAWN GRASS SEED

Thorburn's Lawn Grass Seed for the South

A mixture of grasses that stand extremes of heat and drought well, will grow and thrive vigorously under these conditions and are therefore peculiarly adapted for southern lawns.

Thorburn's Lawn-Restoring Grass Seed

A mixture of grasses peculiarly suited to take firm hold and grow quickly on hard, worn-out or burned spots. The best time to re-sow such places is very early in the spring; but seed may also be sown with good results in the fall from the first of September to the first of October. Some Lawn-restoring Grass Seed should also be sown before every summer rain on thin places.

Permanent Grass Seed for Golf-Links, Tennis-Courts, Polo-Grounds, etc.

We have devoted much attention to the seeding and preservation of golf-links, tennis-courts and polo-grounds, and offer the following mixtures, which have been used on many of the finest links, etc., in the country, with very satisfactory results.

Polo-Grounds Mixture

A mixture of fine-leaved and deep-rooting grasses, forming a strong and lasting turf that will stand hard usage. Per bushel of 20 pounds, \$4.

Tennis-Court Mixture

A mixture of extra-fine grasses peculiarly adapted to tennis-courts. This mixture will make a firm, green and lasting turf of the finest texture, that will improve with the trampling it receives.

Grass Seed Mixtures for Meadows and Pastures

It is a well-ascertained fact that a thicker and more prolonged growth is produced by a mixture of many sorts of grasses than by only one or two. For every different kind and condition of soil there are grasses that are especially suitable. Some sorts do best on high ground and in dry weather; others prefer plenty of moisture. Some mature so early and others so late that from the beginning of spring until winter sets in there is no time when one species or another is not at its best. Grass seed may be sown either early in spring or in fall from the first of September to the middle of October in this latitude.

For about a hundred years our house has made a specialty of grasses. We were probably the first to introduce to this country, for commercial distribution, the many valuable natural and cultivated foreign species that now take such an important part in our agricultural economy. The formation of permanent pastures and meadows has, for many years, been a subject of careful study with us, and the following formulæ for seeding grass-lands have received universal recognition. The quantities given are the minimum. and may often be increased to advantage.

The various grasses used in the above mixtures are fully described on the following pages.

We are always glad to make up Special Mixtures, and are pleased to answer inquiries as to the best grasses for different purposes and for sowing on various soils under varying climatic conditions.

Grass Seeds

We desire to call particular attention to the fact that Grass Seeds are sold in the trade by sample, and each sort is divided into three or four grades of quality, according to purity, germination and weight. The price of the best grade is often double that of the ordinary. The Grass Seeds here offered by us are in every case the VERY HIGHEST GRADE.

Not less than one pound of any one sort sold

Prices subject to market fluctuations during the season. The weight per bushel is average actual weight

AGROSTIS CANINA (Rhode Island Bent Grass). Resembles Red-Top (A. vulgaris, described below), but is of dwarfer habit, with shorter and narrower leaves. It makes a beautiful, close, fine turf, and is one of the very best grasses for lawns in mixture with other sorts. It adapts itself to almost any soil, rich and moist, or dry, sandy and sterile. 60 lbs. of seed to the acre is recommended for lawns. (16 lbs. to the bushel.) Lb\$0 35 25 lbs
AGROSTIS STOLONIFERA, TRUE (Creeping
Bent, or South German Fiorin). The only true Creeping Bent Grass. The distinctive feature of this species is, as the name implies, its compact, creeping, rooting stems. It is of rapid growth and spreading habit, and the stoloniferous roots which it sends down into the soil form a strong, enduring turf that is positively improved by constant trampling. The other varieties of Agrostis are distinguished from this sort by their flattened, parallel surface roots. Being of fine texture, it is most valuable for lawns and putting-greens. If sown alone, 60 lbs. to the acre should be used. (18 lbs. to the bushel.)
Lb \$0 50 25 lbs \$10 25 10 lbs 4 50 100 lbs 40 00
AGROSTIS VULGARIS (Red-Top; Herd's Grass).
A very hardy, native perennial grass, succeeding best on moist land. It accommodates itself to a variety of soils, however, even to dry situations, and stands our hot climate admirably. It is, perhaps, the most permanent grass we have, and it enters largely into the composition of our best natural pastures. It remains green for the greater part of the year, and its long, trailing stems form a very close, matting turf that is not affected by trampling. The seed, as usually sold, weighs 15 to 18 lbs. to the bushel, in its natural condition. Sow 4 bushels to the acre. Lb
10 lbs
RED-TOP GRASS, FANCY HEAVY. Absolutely clean and free from chaff. About 36 lbs. to the acre. (36 lbs. to the bushel.) Lb\$0 50 25 lbs\$10 25 10 lbs\$4 000
AIRA CÆSPITOSA (Hassock Grass). A coarse
grass, preferring stiff and marshy bottoms and thriving in moist and shady woodlands. 30 lbs. to the acre. (18 lbs. to the bushel.) Lb\$0 25 25 lbs\$5 25 10 lbs20 00
AIRA FLEXUOSA (Wood Hair Grass). Delights in
high and rocky hills; it is of little agricultural value except for sheep pasture. 30 lbs. to the acre.

ALOPECURUS PRATENSIS (Meadow Foxtail).
One of the best permanent pasture grasses for
rich, moist soil. Its chief characteristics are its
earliness and its faculty of standing high summer
heats without burning. It prefers moist, low
grounds, but it accepts drier situations, and
makes an earlier spring verdure than any other
variety. Sow only in connection with other
grasses, 3 to 4 lbs. to the acre; if sown alone, 25
lbs. to the acre.
Lb \$0.40 25 lbs \$7.75

Lb.....\$0 40 | 25 lbs....\$7 75 10 lbs.....3 75 | 100 lbs.....30 00

AMMOPHILA ARUNDINACEA (Beach Grass). Valuable on the sandy seashore, canal and railway banks, etc. Its strong, creeping, matting roots bind the drifting sand into natural embankments against the action of winds and waves. This grass is usually propagated by transplanting in the fall. Where it is necessary to use seed, it should be sown in spring, and ground covered with brush to hold the seed in place until it has taken firm hold. Lb. 75 cts.

ANTHOXANTHUM ODORATUM (True Perennial Sweet Vernal Grass). For a mixture with pasture grasses, it is valuable on account of its vernal growth, and also for continuing to throw up root foliage until late in the autumn. For meadows, its chief merit is the fragrant odor which the leaves emit when partially dried, thus sweetening hay. It is a vegetable condiment, rather than a grass of much nutritive value. From 2 to 3 lbs. to the acre, when mixed with other grasses.

Lb......\$0 55 | 10 lbs.....\$5 00

ANTHOXANTHUM ODORATUM PUELLI (Annual Sweet Vernal Grass). Much smaller than the perennial, and of much less value, lasting one year only. 20 to 25 lbs. to the acre.

Lb.....\$0 28 | 25 lbs....\$6 50 10 lbs....2 70 | 100 lbs....25 00

AVENA ELATIOR (Tall Meadow Oat Grass). Most valuable for pasture on account of its early and luxuriant growth; it produces an abundant supply of foliage, which is relished by cattle early and late. For hay it may be cut twice a year, and for green soiling it may be cut four or five times in favorable seasons. It is very hardy, and withstands extreme drought and heat and cold. It is very valuable for our southern states, where it is extensively cultivated for winter grazing and for hay. 50 lbs. to the acre.

Lb.....\$0 26 | 25 lbs....\$5 75 10 lbs....2 40 | 100 lbs....22 00

AVENA FLAVESCENS (True Golden Oat Grass). Will not thrive well when sown alone, but with other species it becomes desirable for dry meadows and pastures. About 25 lbs. to the acre. Lb., 90 cts.

GRASS SEEDS, continued

BEACH GRAS	SS. See A	mmophila	arundinacea.
------------	-------------	----------	--------------

BERMUDA GRASS (Cynodon dactylon). A most valuable grass for our southern states, both for pasture and lawns. It is of dwarf habit, with long, creeping stems rooting at the joints and covering the ground with a matting of fine turf, which no amount of trampling will impair. It is also useful for binding drifting sand and for steep embankments subject to wash. When established it is difficult to eradicate, and is therefore unsuitable for temporary pastures. It requires heat and moisture to start it. As it cannot endure frost, it is of no value north of Virginia. It thrives in the poorest and sandiest soil, and resists extreme drought and intense tropical heat. It should be sown at the rate of 15 lbs. to the acre.

Lb. . . \$0 50 | 25 lbs. . . \$10 25 10 lbs. . . . 4 50 | 100 lbs. . . . 40 00

BLUE GRASS, Canada. See Poa compressa.

" English. See Festuca pratensis.
" Kentucky. See Poa pratensis.

BROMUS INERMIS (Awnless or Smooth Brome Grass). An erect perennial, 3 to 5 feet high; native of Hungary. The nutritive quality of its hay, however, is generally inferior to that of our standard native sorts, so that we should recommend it only for dry, arid soils where the better and more delicate grasses would not grow. It is strongly stoloniferous, its creeping rootstocks spreading rapidly under ground and giving out new plants. It is on this account undersirable for temporary meadows, being difficult to eradicate when once established. Sow 35 to 40 lbs. to

the acre.
Lb.....\$0 25 | 25 lbs.....\$5 25
10 lbs.....2 35 | 100 lbs.....20 00

CALAMAGROSTIS ARENARIA. See Ammophila arundinacea.

A stoloniferous perennial, forming a smooth, compact and lasting turf. It thrives best on rich, moist land, but it can accommodate itself to almost any soil. Its roots penetrate deeply into the ground, which enables it to stand severe droughts. It makes a good bottom grass and is therefore valuable in mixtures for lawns and putting-greens. It thrives well in the shade. The color is the same as that of the Kentucky Blue Grass, and it is, therefore, excellent in mixture with that sort. If sown alone, 30 pounds to the acre is none too much, but it is recommended only in mixture with other sorts.

Lb......\$0 35 | 25 lbs....\$7 25 10 lbs.....3 00 | 100 lbs.....28 00

DACTYLIS GLOMERATA (Orchard Grass; Cocksfoot). One of the grasses most employed in permanent meadows, either for pasture or for mowing. It is very hardy and succeeds well anywhere

DACTYLIS GLOMERATA, continued

DOG'S-TAIL, CRESTED. See Cynosurus cristatus.

ELYMUS ARENARIUS (*Lime Grass*). Valuable on the sandy seashore, canal and railroad banks, etc. It tends, with its tough, wide-spreading and thickly matting roots, to form natural and permanent embankments, thus serving to prevent the drifting of the sand and to protect an exposed shore from wind and waves. It is of no agricultural value. Lb. 80 cts.

FESTUCA DURIUSCULA (*Hard Fescue*). This is a variety of *F. ovina*, dwarfer and less vigorous in growth, but possessing all the other valuable characteristics of that variety. It is emphatically a grass for dry lands, doing well on sandy and shallow silicious soils. It is exceedingly hardy and withstands extremes of heat and cold, and also long periods of drought. For permanent pastures on poor lands, it is especially valuable; but it may also be used in meadow mixtures for well-manured clayey lands. In the latter case it has been known to yield a good crop of excellent hay and a very large aftermath. On account of its stooling habit, it is not recommended for lawns. 30 lbs. to the acre.

Lb.....\$0 26 | 25 lbs....\$5 75 10 lbs....2 40 | 100 lbs....22 00

FESTUCA ELATIOR (*Tall Fescue*). This grass succeeds best in moist, alluvial and strong, clayey soils. It is very productive and of long duration, and is especially valuable for permanent pasture. Stock of all kinds eat it readily, and its nutritive value is very great. On rich, moist lands it yields a large amount of hay of excellent quality. It is not suitable for lawns. 40 lbs. to the acre.

Lb.....\$0 35 | 25 lbs....\$7 25 10 lbs.....3 00 | 100 lbs.....28 00

FESTUCA HETEROPHYLLA (Various-leaved Fescue). A very early, hardy perennial, 2 to 3 feet high, thriving best in cold, moist soils that are rich in humus and potash. In such soils it yields heavily, and is valuable in grass mixtures for permanent meadows either for mowing or grazing. Its great production of root-leaves makes it an excellent bottom grass. Its nutritive value is very high. It grows very well in the shade and is highly recommended for shaded lawns in mixture with other grasses. 40 lbs. to the acre.

Lb....\$0 35 | 25 lbs...\$7 75 Io lbs.....3 25 | 100 lbs....30 00

GRASS SEEDS, continued

GRASS SEEI
FESTUCA OVINA (Sheep's Fescue). A native both of America and Europe. In our northwestern states there are many varieties of it, some of which grow 2 to 3 feet high. It prefers dry uplands and thrives in poor, shallow, gravelly soils, where other grasses would fail. It is very hardy, resisting extreme heat and cold. Though of dwarf growth, it grows thickly, yielding a large amount of nutritious herbage. In grass mixtures, for pastures on high and dry lands, it is especially valuable. Though a "bunch grass," it may be
mixtures on account of its fine foliage and dwarf dense growth. 35 lbs. to the acre. Lb\$0 35 25 lbs\$7 25 10 lbs\$3 00 100 lbs28 00
FESTUCA PRATENSIS (Meadow Fescue, or English Blue Grass). One of the grasses most used in permanent or temporary meadows for mowing or for pasture. It succeeds best in cold, moist, light soils, in well-drained meadows and in low valleys rich in organic matter. It should not be grown at all on warm, dry land. It does not reach its full development till the second or third year, when it far exceeds most other sorts in the quantity of its produce and nutritive matter. After being mown, it grows again very quickly. The forage, either green or dried, is very nourishing and much relished by cattle, especially when cut young. 40 lbs. to the acre. Lb
FESTUCA RUBRA (Red or Creeping Fescue). True. A creeping-rooted species forming a close and lasting turf, and especially adapted for dry, sandy soils. It resists extreme drought, and thrives on very inferior soils, gravelly banks and exposed hillsides. It is also valuable for shady places in lawns, as well as for golf-courses and for binding shifting sands on the seashore. (24 lbs. to bushel.) 30 lbs. to the acre. Lb
FESTUCA TENUIFOLIA (Slender Fescue). This is really a variety of Festuca ovina, with much finer leaves. It will grow on very dry and inferior soils, and its dwarf habit of growth and fineness of leaf render it not unsuitable for dry slopes on lawns and golf-links. It stands grazing well, is very hardy, and lasts long, and may therefore be recommended for permanent pasture on high and dry situations. 30 lbs. to the acre. (22 lbs. to bushel.) Lb
FOXTAIL. See Alopecurus pratensis.
HOLCUS LANATUS (Meadow Soft Grass; Velvet Grass). This grass is of fair agricultural value and it will thrive on poor soil, where better sorts will not grow. It is a perennial, very hardy and grows rapidly. As a forage plant its nutritive value is small, yet it makes a hay that is eaten readily by cattle, especially when it is sprinkled with salt. 35 lbs. to the acre. Lb
10 lbs
or nation.

JOHNSON GRASS. See Sorghum Halepense, p. 61.

2	
ontinued	D
LOLIUM PERENNE (Pacey's Perennial Grass). Although called a perennial, it sel	dom
lasts more than three or four years. It is the	nost
valuable grass of Great Britain, both for pas	ture
and for meadows, occupying there the same	rela-
tive position of importance that Timothy here. The cool, moist climate of England seen	olds
suit it best, yet it succeeds very well in our mi	ddle
and eastern states, and adapts itself to a g	reat
diversity of soils. The seed is large and heavy,	and
produces a strong, verdant growth in four or	five
weeks after sowing. It cures into hay havi sweet flavor, and is much relished by cattle	ng a
horses. Its nutritive value, especially in mix	and
with Red Clover, is very great. It is excellen	nt in
mixtures for quick effects in lawns or golf-li	inks
60 lbs. to the acre. (28 lbs. to bushel.)

GRASS SEEDS, continued

PHALARIS ARUNDINACEA (Reed Canary Grass). A hardy perennial, preferring stiff, wet land but also doing fairly well in dry, sandy soils. It grows well in ditches and by riversides, where its strong, creeping root-stocks render it valuable for binding the banks. Its seed also affords food for trout and wild fowl. When young, it is valuable for cutting for green forage for cattle, but in its more mature state, it becomes too coarse for this purpose. (30 lbs. to bushel.) Lb. 75 cts.

PHLEUM PRATENSE (Timothy). A native of Europe, but long ago naturalized in America, where it ranks as by far the most important of hay grasses. On moist, loamy or clayey soil it produces a larger hay crop than any other grass. It is not so well suited for light, sandy soils, though preferring a moist, temperate climate, it withstands drought and extreme heat and cold. Its hay is very nourishing and can be preserved for a long time. It should be cut when flowering, as if left later the hay becomes hard and coarse. It is often sown with Red-Top Grass and Red Clover, and the nutritive value of the hay is greatly increased by this mixture. If sown alone, at least 25 lbs. to the acre should be used; with Red-Top Grass and Red Clover, 15 lbs. of Timothy, 12 lbs. of Red-Top Grass (natural) and 3 lbs. of Red Clover; or with Red Clover only, 20 lbs. of Timothy and 5 lbs. of Clover. The seed weighs 45 lbs. to the bushel. Several grades are always on the market, differing in purity and vitality, but the seed we offer is of the very highest quality and extra clean. It is always most economical to buy the highest grade, known as "Fancy."

POA AQUATICA (Water Meadow Grass). This is an excellent pasture grass for very wet situations. It also does well in bogs and marshes. 20 lbs. to the acre. Lb. 90 cts.

POA COMPRESSA (Canada Blue Grass). Highest grade. A very hardy perennial grass, with creeping root-stocks. It grows on the poorest and driest soils, sandy, gravelly or clayey, standing extremes of wetness or drought, and keeping green until the severe frosts of winter. It is especially valuable for dairy pastures, cows feeding on it yielding the richest milk and finest butter. It is distinguished from the Kentucky Blue Grass by its flattened, wiry stems and by its decidedly bluer color. 60 lbs. to the acre.

Lb. \$0 18 | 25 lbs \$3 75 10 lbs 1 60 | 100 lbs 14 00

P	OA NEMORALIS (Wood Meadow Grass). The
	chief characteristic of this grass is its special fitness
	for shaded positions in lawns and woodland parks,
	where other grasses will not grow. It is very per-
	manent and hardy, resisting extremes of heat and
	cold, and is one of the first grasses to show a rich
	green growth in the spring. The creeping roots
	are formed under ground, and make a good turf.
	Excellent for pasture. 30 lbs. to the acre. (19
	lbs. to bushel.)
	Ib \$0.60 25 lbs \$12.00

10 lbs...... 5 50 | 100 lbs...... 50 00

POA PRATENSIS (Kentucky Blue Grass; June

Grass). Highest grade. One of the most widely distributed and valuable native grasses. It combines more points of excellence than any other sort. It is a true perennial, lasting indefinitely and improving every year. Its densely creeping root-stocks, spreading habit and smooth, even growth, fine texture, and rich green color render it one of the very best grasses for lawns. It forms a close turf, starts very early in the spring, and lasts till frost. It succeeds in almost any soil—dry, rocky, sandy or gravelly—and stands long-continued dry weather and hot suns. It takes, however, two or three years to become well established, and should, therefore, be sown only in connection with other grasses. If the soil is especially suitable it will eventually crowd these out, and make the finest possible sward. It is one of our most valuable pasture grasses, very productive and nutritious. 50 lbs. to the acre.

Lb....\$0 25 | 25 lbs...\$4 75 10 lbs....2 00 | 100 lbs....18 00

POA TRIVIALIS (Rough-stalked Meadow Grass). A spreading, thickly matted, stoloniferous-rooted species, forming a fine turf, and adapted for shaded portions of lawns. It thrives on rich, moist soil and in sheltered situations, but not on dry land. Valuable for forming bottom grass in mixtures for permanent pastures. 20 lbs. to the acre. (26 lbs. to bushel.)

FOR CLOVERS, SEE NEXT PAGE

For Special Meadow and Pasture Mixtures, see page 52; and for Cereals and Field Corn, and Forage, Economical and Miscellaneous Seeds, see pages 58 to 61. Fertilizers are quoted on page 130.

The books listed on pages 48 and 57 will be found invaluable helps to the Home or Commercial Gardener, the Farmer, Dairyman and the Stockman.

Clovers

We quote present prices on Clovers as near as it is possible to offer them at as we go to press. We shall be very glad to quote prevailing prices on all of them from time to time, and we solicit inquiries. It is understood, of course, that all are subject to market fluctuations.

ALFALFA, or LUCERNE (Medicago sativa).
Requires deep, rich, well-drained soil. The tap-
root descends often to a depth of 10 to 15 feet
in loose soil. It is, consequently, capable of re-
sisting great droughts. It should be sown alone
(about same time as oats are sown in this section)
in thoroughly prepared, deeply plowed soil, at the
rate of 20 to 25 pounds to the acre. It may also
be sown as late as August and up to the middle of
September in more southerly localities. The crop
should be cut when the plant is coming into
bloom. In suitable soil it is perennial, and several
crops may be cut every year. American seed.

Forage, Economical and Miscellaneous Seeds

Except where noted, these seeds are not sold in packets. From 10 cts. to 25 cts. worth is the smallest quantity put up. All subject to change in price.

ASPERULA odorata (Waldmeister). Perennial, growing only about 6 inches high, with very fragrant flowers. In Germany, it is thought much of as imparting a certain bouquet to Rhine wine, making the well-known Maitrank. Pkt., 10 cts.; oz., 75 cts.

AUSTRALIAN SALT BUSH (Atriplex semibaccata). Thrives in soils on which nothing else will grow, and it is highly recommended for alkali soils and all regions subject to periodical drought. It is very nutritious, and good for all kinds of live-stock. Two or three pounds of seed are sufficient for an acre. The seed may be sown in beds, and the seedlings planted out when 2 inches high, 3 feet apart. Grows strong and vigorously in the driest seasons. Oz., 15 cts.; lb., \$1.25; 100 lbs., \$90.

BEANS (60 lbs. to the bushel)—

Velvet Bean (Dolichos multiflorus). Used in the South as a forage plant, and as a fertilizer plant for turning under. Stock readily eat the vines and leaves, and the Beans, when ground with or without the pod, are used in place of oats or corn, or mixed with them. Plant in rows 4 feet apart and I foot in the row, 2 or 3 Beans in a place, as soon as danger of frost is past. The vines are strong and vigorous in growth, rapidly covering the ground, and bearing immense quantities of Beans. Qt., 25 cts.; bus., \$4.50.

Soja Bean (Glycine hispida). Thrives well in hot and dry weather. Plant at the rate of ½ to $\frac{34}{4}$ bushel to the acre, in drills $2\frac{14}{2}$ or 3 feet apart, and cultivate same as field corn. It does not make good hay, but is good as ensilage or green fodder.

Early Dwarf Green. An early-maturing variety, best for the North, or sections where Hollybrook and Mammoth Yellow do not have time to mature. Pk., \$1; bus., \$3.50.

Hollybrook Early. A vigorous, quick-growing variety. Pk., \$1; bus. \$3.50.

Mammoth Yellow. The largest-growing Soja Bean, valuable for green fodder and for improving the soil. Pk., \$1; bus., \$3.

BEGGAR-WEED (Florida or Giant Beggar-weed; Desmodium tortuosum). An erect, leguminous annual, growing from 3 to 8 feet high, with abundant foliage, valuable as forage or for soil renovation in subtropical regions; it also makes hay of a fine quality. It should be sown at the rate of 10 pounds to the acre, after the ground is ground at pounds to the acre, after the ground is warm and moist. The seed should be but very lightly covered. If for hay, it should be cut just as it begins to bloom. Lb., 40 cts.; 100 lbs., \$35.

BERSEEM. See under Clover, page 57.

BROOM CORN (Sorghum vulgare). (12 quarts to the acre.) Broom Corn succeeds in a good, deep soil, fresh but not damp, and it is very sensitive to cold.

Long-Brush Evergreen. Lb., 15 cts.; 100 lbs., \$6.

BROOM CORN, continued

Improved Dwarf. Lb., 15 cts.; 100 lbs., \$6. California Golden Long-Brush. Grows from 12 to 14 feet high. Lb., 15 cts.; 100 lbs., \$6.

BROOM, Scotch (Genista scoparia). The young growth of this shrub is chiefly valuable as food for sheep and other animals in winter. It is also employed for the making of coarse brooms. Oz., 15 cts.; lb., \$1.

BURNET, Common Field (Poterium sanguisorba). Perennial; makes excellent pasture for sheep; grows on the poorest ground-on dry, sandy or calcareous soils; resists the extremes of heat and cold, and is very vigorous. Sow in April, and again in September, with sainfoin, clover, rye, grass, etc., 30 lbs. to the acre. Lb., 25 cts.; 100 lbs., \$20.

CASTOR BEAN (Ricinus). The plant from which castor-oil is made. Qt. 25 cts.; bus., \$6.

CATERPILLARS, HAIRY (Scorpiurus). A curious plant; of interest only on account of the peculiar fruits from which its name is derived. Amusement is caused by mixing them in salads. Pkt. 10 cts.; oz. 60 cts.

CHICORY, Large-rooted (Cichorium Intybus).
When the roots are dried, roasted and ground they become the Chicory of commerce, and are used in adulterating coffee. Oz., 10 cts.; lb., 90 cts.

COTTON SEED.

Sea Island. Lb., 20 cts.; 100 lbs., \$15. Upland. Lb., 20 cts.; 100 lbs., \$15. Upland Big Boll. Very prolific. Lb., 25 cts.; 100 lbs., \$20.

COWPEAS (Vigna Catjang). Specially adapted to warm countries; extensively grown in our southern states; also valuable in this latitude as a fodder-plant. The chief value of Cowpeas, however, is as a green crop to plow under. The seed should not be sown till the ground has become well warmed. Sow I bushel to the acre, in drills; 2 or 21/2 bushels to the acre if sown broadcast.

Black. Standard variety; early and very prolific. Pk., \$1.25; bus., \$4.

Clay. A little later than the Black; prolific in both peas and growth of vine. Pk. \$1.25; bus., \$4.

New Era. Upright-growing, quick to mature and very prolific of peas. Pk., \$1.25; bus. \$4.

Red Ripper. Early and prolific, desirable sort. Pk., \$1.25; bus., \$4.

Whippoorwill. A favorite sort; makes a good growth of vine and very good for improving the land. Pk. \$1.25; bus., \$4.

MER. (Sometimes advertised as "Speltz," though this name is incorrect, the true Speltz EMMER. being a different article.) It is grown quite extensively in the Northwest, having been brought by the Germans from Russia, where it is considered a valuable cereal on account of its hardiness and drought-resisting qualities. Lb., 15 cts.; 100 lbs., \$7.

FORAGE, ECONOMICAL AND MISCELLANEOUS SEEDS, continued

- ESPARSETTE. See Onobrychis sativa.
- FENUGREEK (Trigonella fænum-græcum). Annual. This seed is often sought by hostlers to give temporary fire and vigor to their horses. It is frequently given to oxen and pigs when fattening, causing them to drink and digest their food. Considered to be good for soiling when green. Oz., 10 cts.; lb., 25 cts.
- FLAX, NATIVE (Linum usitatissimum). Lb., 15 cts., 100 lbs., \$10.
- FURZE (Ulex europæa). Also known as Whin and Gorse. A perennial leguminous shrub. The crushed sprigs of one year's growth of this shrub furnish an excellent green fodder in winter. It grows well on barren hillsides and in sandy soil. Sheep are fond of it. 25 lbs. to the acre. Oz., 20 cts.; lb., \$2.
- HOP SEED (Humulus lupulus). Pkt., 10 cts.; oz., 60 cts.
- JERSEY WINTER KALE, or Cow Cabbage. Excellent for feeding cattle; very hardy. Pkt., 5 cts.; oz., 10 cts.; 1/4lb., 20 cts.; lb., 60 cts.
- JERUSALEM CORN. See under Sorghum, page 61.
- JUTE (Corchorus). Annual. Thrives in any good corn ground. Sow in drills, about 8 inches apart, 4 pounds to the acre. Requires no cultivation, as it will outstrip in growth all weeds. May be also sown broadcast, 6 or 7 pounds to the acre. Oz., 15 cts.; lb., 75 cts.
- KAFFIR CORN. See Sorghum, page 61.
- KIDNEY VETCH, or Sand Clover. See Clovers, page 57.
- LIQUORICE (Glycyrrhiza glabra). Seed in pods. Oz., 75 cts.
- LOTUS corniculatus (Bird's-foot Trefoil). Perennial; used in pastures. Cattle and sheep eat it readily, and it is said to be quite nutritious. It grows on the lightest and most sterile soils, and can withstand severe droughts. Is excellent for sowing in mixture for dry pastures. Lb.,
 - villosus, or major (Greater Bird's-foot Trefoil). Lb., \$2.
- LUPINE, Yellow. Succeeds well in the poorest soil, and is exceedingly valuable for plowing in to improve sandy soils. It makes good forage, either green or as hay. The seeds are very fattening when used with hay. Sow in the spring when the ground has become thoroughly warm, at the rate of 90 lbs. to the acre. Lb., 15 cts.; 100 lbs., \$8.
 - White (Large Flat Seed). One of the best plants known for green manure, as it gathers large quantities of nitrogen from the air. It may be sown from April to July, and plowed under when in flower. The seed, when burned, is excellent manure for orange and olive trees. Lb., 15 cts.; 100 lbs., \$8.

 Blue. Used for the same purpose as the White.
 - Lb., 15 cts.; 100 lbs. \$8.
- MADDER (Rubia tinctoria). A perennial, the roots of which, when dried and reduced to powder, furnish a red coloring matter. Oz., 20 cts.; lb., \$1.25.
- MILLETS. See Miscellaneous Cereals, page 58.

- ONOBRYCHIS sativa (French, Sainfoin; German, belonging to the same family as clover and lucerne. It is a valuable plant for growing on poor land and barren hillsides. When once well established, it lasts for many years. If to be used for hay, cut just before the flowering period. Sow in spring, covering the seeds quite deeply, at the rate of 80 lbs. to 100 lbs. to the acre. Lb., 25 cts.; 100 lbs., \$15.
- OSAGE ORANGE (Maclura aurantiaca). Useful for hedges. Oz., 10 cts., lb., 50 cts.; 25 lbs. and up at 40 cts. per lb.
- PEARL MILLET (Penicillaria spicata). A valuable fodder-plant for the South; is enormously productive. Sow the seed in drills 18 inches apart, and 8 to 10 pounds to the acre. Lb., 15 cts.; 100 lbs., \$12.
- PEAS, Canadian Field. Valuable for northern climates, for cattle-feeding, especially for milch cows. It also makes fine ensilage. It is sown broadcast in the spring and harrowed in. If sown with oats, about 11/2 bushels to the acre; in drills, 2 to 3 bushels to the acre. Qt., 20 cts.; bus., \$3.
- PENICILLARIA spicata. See Pearl Millet.
- POPPY, Opium (Papaver somniferum). The seed furnishes an agreeable sweet oil, used for the table, also for painting and for illuminating. May be sown in spring, either broadcast or in drills, covering thinly. Also cultivated for opium. Oz., 20 cts.; lb., 75 cts.
- POLYGONUM sachalinense (Sacaline). Hardy perennial, native of the island of Saghalin, between Japan and Siberia. It grows well on the poorest soils, and endures the extremes of heat and cold. Reaches a height of 10 to 12 feet, and can be cut two or three times in the season. The stems and leaves, which are very nutritious, are eaten either green or dry by cattle and sheep, and much relished. Clean seed, oz., 50 cts.; lb., \$5.
- RAMIE, Silver China Grass (Urtica nivea). Extensively cultivated for its fiber. The seed should be germinated on cotton floating in lukewarm water, and transferred to a bed, screened from the hot sun. When the plants are 4 inches high, transplant to a field in rows 4 feet apart each way; when 3 feet high, turn them over and peg down, covering with earth, and they will start in every direction. Oz., \$1;
- RAPE, Dwarf Essex English (Brassica napus).

 Largely grown in the northern United States, and in Canada. It is excellent for sheep-pasture, and also for soiling. It may be sown in May, and will be ready for pasturing in July and August; or, it may be sown in June or July, and yet furnish a large amount of pasture or fodder. In drills, sow 5 pounds to the acre; sown broadcast, 10 pounds to the acre. Lb., 15 cts.; 100 lbs., \$10.
- REANA luxurians (*Teosinte*). Short crop. A valuable fodder-plant from Central America, in growth resembling Indian corn. Well adapted to our southern states. Oz., 15 cts.; lb., \$1.
- RICE SEED, for sowing. Best Carolina. Lb., 10 cts.; 100 lbs., \$8.

FORAGE, ECONOMICAL AND MISCELLANEOUS SEEDS, continued

SAINFOIN. See Onobrychis, page 60.

SALT BUSH. See Australian Salt Bush, page 59.

SACALINE. See Polygonum sachalinense, page 60.

SERADELLA (Ornithopus sativus). A valuable forage-plant, admitting of one, and sometimes two, cuttings in one season. It succeeds well in a dry, sandy soil and furnishes a good pasture for sheep. It may also be cured for hay. Can be sown with winter rye. About 50 pounds to the acre. Lb., 18 cts.; 100 lbs., \$12.

SNAILS (Medicago scutellata). Used in the same way as Caterpillars. Pkt., 10 cts.; oz., 50 cts.

SORGHUM. Twenty-five pounds required to the acre if sown in drills. For dry fodder, 2 bushels should be sown to the acre.

Early Amber Sugar Cane. Ripens wherever Indian corn matures. Grows 10 to 12 feet high. Lb., 15 cts.; 100 lbs., \$7.

Brown Dhoura. Lb., 15 cts., 100 lbs., \$7.

Halepense (Johnson Grass). One of the most valuable southern fodder plants. On rich soils it may be cut three or four times in a single season, and it is claimed that hay made from it is equal in value to timothy. Sow in August and September, 35 to 40 pounds to the acre. Lb., 20 cts.; 100 lbs., \$15.

Holcus saccharatus (Sugar Millet). Rich in saccharine matter, and a large amount of nutritive fodder can be obtained from it. Lb., 15 cts.; 100 lbs., \$10.

Jerusalem Corn (White Dhoura). Lb., 15 cts.; 100 lbs., \$10.

Red Kaffir Corn, or Sorghum. Non-saccharine. The plant is low, stalky, perfectly erect. The whole stalk, as well as the blades, cures into excellent fodder, and in all stages it is available for green feed. Lb., 15 cts.; 100 lbs., \$6.

White Kaffir Corn. Lb., 15 cts.; 100 lbs., \$8.

Early Orange Sugar Cane. Ripens about ten days after Early Amber, and is said to produce a larger crop. Lb., 15 cts.; 100 lbs., \$7.

Sorghum, Shallu. A non-saccharine Sorghum from India, also known as Egyptian wheat. Requires more room to develop than ordinary Sorghum, and consequently needs less seed to sow an acre. Lb., 15 cts.; 100 lbs., \$7.

Yellow Branching (Yellow Millo Maize). Non-saccharine; useful for the large amount of foliage, green feed or cured fodder that it furnishes, and for its grain. Lb. 15 cts.;

100 lbs., \$5.

SPURRY (Spergula arvensis). Annual. Grows well on poor, dry, sandy soil; may be sown every month from March to August. Excellent pasture for cattle and sheep; also of much value as a fertilizer for light soil. 15 pounds to the acre. Lb., 15 cts.; 100 lbs., \$10. Giant Spurry. Lb., 20 cts.; 100 lbs., \$12.

SUNFLOWER, Large Russian. Lb., 12 cts.; 100 lbs., \$9.

TEOSINTE. See Reana luxurians, page 60.

TOBACCO SEED. See page 47.

ULEX europæa. See Furze, page 60.

VELVET BEAN. See page 59.

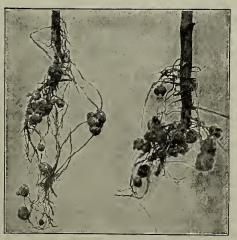

VETCHES, Spring Tares (Vicia sativa). Sown broadcast at rate of 60 to 100 pounds to the acre, like wheat or barley, and sometimes mixed with oats for soiling. Used in France and Canada as a substitute for peas. Price variable. Present quotation, lb., 10 cts.; 100 lbs., \$6.50.

Sand, Winter or Hairy Vetch (Vicia villosa).

Thrives on poor, arid, sandy soils. It may be sown either in fall or in spring, mixed with rye for a support. Grows 3 to 4 feet high, and can be cut as soon as the bloom appears, and again for the seed. Perfectly hardy. Sow from 30 to 50 lbs. to the acre. Price variable. Present quotation, lb., 18 cts.; 100 lbs., \$15.

WALDMEISTER. See Asperula odorata, page 59.

WORMS (Astragalus hamosus). Used the same as Snails and Caterpillars. Pkt., 10 cts.; oz., 50 cts.

FARMOGERM

A preparation of high-bred, nitrogen-gathering bacteria in sealed bottles, ready to use, with water added according to directions. Bottles contain enough Farmogerm to inoculate the seeds for one acre. Prepared for the following crops:

White Clover Cowpeas Red Clover Vetches Crimson Clover Canada Field Peas Alsike Clover Garden Peas Alfalfa Clover Sweet Peas Garden Beans Soy Beans

Price per acre bottle, \$2; per five-acre bottle, \$9. State for what crop Farmogerm is wanted, when ordering.

Also in garden size, enough for 1,000 square feet or a 200-foot row, for Peas, Beans, Sweet Peas and White Clover, at 50 cts. per bottle. We secure cultures fresh from the laboratory, hence it takes two or three days to fill orders.

Tree and Shrub Seeds

To preserve seeds of Conifers and other Evergreen Trees, it is best to keep them in perfectly dry sand until the time of sowing. For this latitude, the seeds should be sown thinly, as early in the spring as the ground can be worked, in beds of fine, sandy loam. Cover to the depth of about the thickness of the seed, and press the beds gently with the back of the spade to firm the earth around the seeds. Great care must be taken not to give too much water, as the young plants damp off very easily. Water with a very fine rose, but never so that the ground becomes soggy. Some shade must be used to protect the young plants from the hot sun and winds, and to keep the birds from destroying them. Seeds of the rarer sorts may be sown in coldframes or boxes; if in coldframes, the sashes should be shaded and the frames raised at the corners 3 or 4 inches to allow the air to circulate freely. Keep the young plants well weeded, and allow them to remain one to two years before transplanting.

The propagation of Deciduous Trees from seed is less difficult than that of Evergreen species. Acorns, Hickorynuts, Chestnuts and Walnuts should be planted in autumn, or kept during the winter in earth or moss. They shrivel up by too long exposure to the air, and many of them lose their vitality. Those seeds with hard shells, like the Locust, Gymnocladus, etc., should be planted in autumn or placed in boxes with sand, and exposed to frost before planting. They may not germinate till the second year after planting, and if they are received too late in the spring to expose them to the action of the frost, they may be put into a vessel of hot water for an hour or so before planting. American Elm, Silver Maple and a few other sorts ripen their seeds early in summer, and, if gathered and planted soon after they fall from the tree, will make fine plants the same season. The seeds of other Deciduous Trees and Shrubs should be planted from the middle of April to the middle of May, in drills about 2 feet apart, and covered about $\frac{1}{2}$ inch in depth, according to size.

Some of the varieties here offered are on hand now; many are due from foreign countries, where they are being collected for us. We are, of course, uncertain of getting all of them. As the season advances, many sorts become worthless from various causes, or are sold out, and cannot be replaced until the new crop is ready next season.

EVERGREEN TREE AND SHRUB SEEDS

We do not sell Tree or Shrub Seeds in quantities of less than an ounce of any one variety, except those quoted at over 25 cents per ounce; of these, 25-cent packets may be ordered.

Flower Seeds

PRACTICAL DIRECTIONS FOR CULTURE, TREATMENT, ETC.

HARDY ANNUALS (hA) .-- Sow in April or May, according to the latitude, in shallow boxes or pots placed in a warm window, a hotbed or, if possible, in a greenhouse. A second sowing ought to be made from two to four weeks after for a succession, as well as to provide against failure the first time. For sowing seeds in there is nothing better than shallow boxes from 2 to 3 inches deep, and of any convenient size. The most suitable soil for all the smaller kinds is a very fine, rich, sandy loam. That from old hotbeds is excellent, or sods from an old pasture piled up and allowed to rot for two or three years and then mixed with a little old stable manure and sand. After the seeds are up, care must be taken to give them plenty of air and moisture, yet not too much water, or they will "damp off." When the young plants are well out of the seed-leaf, they must be transplanted to new boxes. If pots 2 inches or more in diameter can be had, set out from three to a dozen or more of the young seedlings along the edges of the pot, so that as soon as the ground is warm enough they may be easily turned out and planted singly, as by that time they will have made good roots. When pots cannot be had, boxes, tin cans, etc., may be substituted.

A common mistake in sowing flower, as well as other, seeds, is covering too deeply. The exception to

this is the Sweet Pea which is seldom planted deep enough. As a general rule, cover only to the depth of the thickness of the seeds; or, with medium-sized seeds, like Balsams, Zinnias, etc., half an inch or so is none too much. Such fine seeds as Portulacas need only to be pressed into the soil with a piece of board or the palm of the hand. Always press the earth down firmly after sowing all flower seeds, else there is danger of their drying up before the roots can get firm hold of the soil. Seeds of the hardier Annuals may be sown where they are to grow; but, as a rule, it is preferable to transplant, as the plants are generally stronger

and stand the drought better. During very dry weather, and when the seedlings are first set out, they should be watered frequently. Provide some support for all such Annuals as require it.

The weeds should be kept down and the ground loosened often, so that the plants will receive the full

benefit of the rains and dews, which they will not if the ground is allowed to become hard and baked.

Seeds of Biennials and some Hardy Annuals may be sown in July and August in the open, and in September in boxes and placed in coldframes. They will make strong plants by spring, and flower early. Do not put on the sashes until heavy rains and frosts begin, and then always remove during the day whenever the temperature is above freezing in winter.

HARDY BIENNIALS (hB) and HARDY PERENNIALS (hP).—These require the same treatment as the Hardy Annuals. In addition to the above, both Hardy Biennials and Perennials may be sown in the open border from July to September. The seeds of many Perennials require several months, some even as long as two years, before they germinate. It is a good plan, at the commencement of frost, to cover the plants lightly with straw, leaves or any dry litter, in order to afford some protection from the extreme severity of the winter. As soon as the frost is out of the ground in the spring, remove the covering and loosen the surface around the plants, which, when large enough, may be transplanted to the flower-garden where they are to remain.

HALF-HARDY ANNUALS (hhA).—These may be sown in shallow boxes, pots or a hotbed, as directed for Hardy Annuals. They may be sown thus at any time after the middle of April, as the hotbed will be sufficient protection; but it is best to cover the glass with a mat or straw at night until danger of frost is past. In the day give all the air possible. After the end of May, sow in the border, like Hardy Annuals.

HALF-HARDY BIENNIALS (hhB) and HALF-HARDY PERENNIALS (hhP) require the same treatment. Though plants and their blooms are greatly forwarded by sowing the seeds early in boxes under cover, it may be stated that nearly all kinds of Hardy and Half-hardy Flower Seeds may be sown in the open border in a warm and sunny spot as soon as the soil has become dry and warm; so that those who have no glass frames or greenhouses need not be without flowers. They can have them, but it will be later.

TENDER ANNUALS, BIENNIALS and PERENNIALS.—The best method to obtain an early bloom of the Tender Annuals (tA), and to insure strength to the plants, is to sow the seeds in boxes or pots in March, placing them in a warm greenhouse or plunging in a moderate hotbed, carefully protecting them from the cold, shading from the midday sun, and watering with a fine rose. The seed should be sown in a very light, sandy compost, and the pots well drained by placing broken pots or bits of sod in the bottom. The finer seeds must not be covered more than an eighth of an inch deep, and the soil pressed down closely over them. Water frequently, particularly if the house or hotbed is very warm. As soon as the plants are out of the seed leaf transplant them into challent house or not leaf to seed them. are out of the seed-leaf, transplant them into shallow boxes or small pots, and when they have acquired sufficient strength, transplant into the flower-beds; not, however, before the middle of May.

GREENHOUSE SEEDS (g) should be sown as directed for Tender Annuals, in pans, pots or shallow boxes, and be kept in the house, carefully watched, slightly watered occasionally, and sheltered from the hot

sun till strong enough to transplant. Most varieties may be sown at any season of the year.

The smaller seeds of Greenhouse Plants are sometimes difficult to make germinate unless great care be taken in the mode of sowing. Hence, the supposition arises that the seed itself is not good, whereas the fault is not in the seed, but in the treatment. Fine seeds of this description should be sown in leaf-mold or peat, with some fine sand added to it; press firmly down in the seed-pan or pot, and make perfectly level at the top so that the mold may not afterward sink materially with watering. Sow the seed very thinly and cover very lightly with a little compost or with silver sand. Success is more certain if a pane of glass is placed over the pan or box till the plants have appeared, when it should be removed. As soon as the young plants have two leaves, they should be transplanted into similar compost in another pan or box. After transplanting, they should be kept in a shady part of the greenhouse for a few days, and watered very sparingly.

ASTER hhA One of the very best Annuals for cut-flowers

The Aster is of easy culture and very popular. Plants from seed sown in the open ground in May bloom finely in September and October. For July and August flowers, sow in March or April in coldframe, spent hotbed, or in pots or boxes in the house. Cover the seeds about half an inch deep with rich, light soil, and, when the plants have three or four leaves, transplant about 18 inches apart each way into well-prepared beds. Manures too fresh or used in too large quantities sometimes induce disease in Asters. When used, they should be thoroughly well decayed and mixed with the soil. Small quantities of slaked lime or fresh wood-ashes stirred into the surface of the Aster beds form good tonics for the plants and keep disease and insects from the roots.

SWEET PEAS (Lathyrus odoratus) hA

N. B.—Intending purchasers are strongly advised to order as soon as possible after receipt of catalogue, as, owing to short crops again last year, it will be difficult to replace the seed when our supply is sold.

Through the skill of specialists, the Sweet Pea has become much larger and lovelier than before it became so popular. There are flowers of quite distinct shapes, some of which are a great improvement upon the Sweet Pea of the old type. For garden decoration it is now grown in clumps, and in separate colors. The plants are more robust, dwarf and branching, and bloom more freely, some varieties showing three or four blooms on a stem.

A deep, rich, moist soil is best suited to Sweet Peas, hence a trench should be dug 1½ feet deep and filled with very best loam mixed with bone meal or well-rotted manure. The vines are usually grown in double rows, with a wire trellis or a row of brush between. For each double row make the drills about 12 inches deep, and 9 or 10 inches apart. Sow plentifully, covering about 2 inches deep, and, by degrees, as the vines grow up, fill the trenches with soil, and thin out to about 2 or 3 inches apart. Spring sowings should be made just as early as the ground can be prepared. The earliest flowers are from seed sown in fall, preferably in a dry situation, and 6 to 8 inches deep, giving them level culture. Sweet Peas should not be grown on the same soil year after year. If the location cannot be changed, the soil to the depth and width of a foot or so should be removed and replaced by soil from another part of the garden or grounds. If the soil is in good, rich condition, bone meal is the best fertilizer.

We do not sell less than 1 oz., $\frac{1}{4}$ lb. or $\frac{1}{2}$ lb. at the prices quoted per oz., $\frac{1}{4}$ lb., $\frac{1}{2}$ lb. and lb. respectively. This applies to all types and to the mixtures

In order to assist our customers in making their selections, we group the different varieties according to color.

Selected List of Flower Seeds

We have unquestionably the largest assortment of Flower Seeds in America, and our strains are far superior to those commonly sold, often under fancy names and at fictitious prices. We avoid extravagant descriptions, meant only to effect sales.

There are many minute plants from the finer seeds killed by drenching with water while very young. In the first stage of their existence, plants require moisture in a minute quantity, often repeated, and not

in such large quantities as to saturate the soil in which they are growing.

FLOWER SEEDS DELIVERED FREE BY MAIL ON RECEIPT OF THE STATED PRICE. PRICE PER OUNCE OR POUND FOR THOSE NOT QUOTED, ON APPLICATION .

Not less than \(\frac{1}{4}\) oz. or 1 oz. sold at the prices quoted per \(\frac{1}{4}\) oz. or 1 oz. respectively

Explanation of Signs Employed in This List

The asterisk (*) designates ornomental-leaved plants. This mark (‡) prefixed indicates the climbers. S represents Shrubs—plants of bushy habit.
g "greenhouse plants.
Bu "Bulbous plants.

A represents Annual—lasting but one year.

B "Biennial—lasting two years.

P "Perennial—lasting three or more years.

E vergreen—retains foliage the entire year.

As a large number of Biennials and Perennials, if sown early, flower the first season from seed, this distinguishing mark (†) is affixed to such.

The hardiness is denoted by the following abbreviations, but it should be understood that this is intended to apply to the climate of the Middle Atlantic States. Farther north or south, these designations apply only in a comparative way.

h represents hardy—plants for open border. hh represents half-hardy—plants that require to be forwarded in pots or frames. t represents tender—requiring protection.

Customers will find it more convenient to order by number. If ordered from any catalogue other than this (1915), kindly state from which year's catalogue the numbers are taken. This will facilitate the filling of their orders and will insure prompt shipment.

AQUILEGIA (COLUMBINE). Few hardy perennials are so easily grown from seed, and will give such unalloyed satisfaction. A most desirable border plant. It forms large clumps, blooms early, long and abundantly, is useful for cutting and elegant in habit. Sow seed in the open ground in spring, preferably where the plants are to grow, and thin to about a foot apart. Sow in the fall for flowering the following season. They thrive well under ordinary garden culture, but such rare sorts as A. cærulea and A. chrysantha do best in partially shaded, well-drained nooks.

" lilacina, Lilac; I ft58925 5	or later in the open ground, the plants will flower finely the second summer. For largest, richest flowers, we recommend culture in pots of rich soil. With many
141	recommend culture in pots of rich soil. With many
	they are also garden favorites, and, grown in this way, flowers of good quality may be enjoyed all summer if
	given plenty of water, good soil and a mulch about their roots. With tall varieties, staking and tying is neces- sary. Young plants are perfectly hardy outdoors, but
	when two or three years old they are injured by winter
	cold, so that sowings should be made every year. The more expensive sorts produce the finest flowers. The prices
Labore V.	we quote, although seemingly high, are most reasonable for strains such as we offer.
	MARGARET CARNATIONS are an extra-vigor-
	ous race, expecially adapted for outdoor culture. They are very neat in habit, and remarkable for their rich
	profusion of flowers, produced in five months from sowing. Grown as annuals from seed sown every spring,
	they are most satisfactory. Our seed of these varieties is grown exclusively in the famous Chabaud Garden of
	Carnations, Provence, France. Pkt.

CELOSIA (Cockscomb)

CRISTATA. We prize and plant the Cockscomb as	an
odd and picturesque decorative feature of the gard	en.
Annuals of easy culture, the bright red and crim	son
varieties are most effective, both in gardens and winter bouquets, for which they are cut before fully in	in
and dried in the house. The dwarf varieties m	ake
novel and attractive borders; the tall ones form st	rik-
ing groups. Transplanting into rich soil about the t	me
the combs begin to form makes the flower-heads m larger. They are bright from midsummer until frost	uch

PERFUNIAL VARIETIES This section inc	-

the large-flowered sorts, and the pretty, hardy Pompons that make bright masses of color in our gardens long after heavy frosts have cut down other flowers. We wish to make quite clear the distinction between this class and the Annual Chrysanthemums described above, so that, as has sometimes happened heretofore, customers may not order seed of the summer-blooming garden varieties, expecting them to yield the grand show flowers of late fall, which are obtained from cuttings carefully cultivated. For ordinary culture and room decoration,

COSMOS. One of the notable fall flowers. A strong, tall-growing annual, with bold flowers of exquisite daintiness and airiness, heightened in effect by their foliage setting of feathery green. It is most effective when planted in broad masses, or long background borders against evergreens or fences. We offer only the choice, large-flowering strains. To make sure of flowering early, Cosmos should be started indoors and transplanted into dry, sandy or poor soil, in a sunny situation.

EARLY FLOWERING. Earliest of all. If seed	is

DELPHINIUM (LARKSPUR). In variety and beauty of its blue tints, which are as numerous as they are charming, no other plant can equal the Delphinium. The brilliant flowers are strongly effective in helder marges in borders by the being a proper of the plant and the plant are strongly of the plant and the plant are strongly of the	DEL
as numerous as they are charming, no other plant can	
equal the Delphinium. The brilliant flowers are strongly	
effective in beds or masses, in borders, shrubberies, or in combination with white lilies. Improvements are continually being made in the size of the flowers, as well	
continually being made in the size of the flowers, as well	
as in the length and fulness of the spikes. Some of the species flower both early and late; the season for all can	
be prolonged by cutting away withered flower-stems.	
All varieties are easily cultivated and adaptable to many conditions, but, in a soil deeply dug and well	
be prolonged by cutting away withered flower-stems. All varieties are easily cultivated and adaptable to many conditions, but in a soil deeply dug and well enriched with fine old manure, their blooms are the finest. Setting them 1½ to 2 feet each way is not too	
much for the taller sorts.	
ANNUAL VARIETIES There include the Bester	
or Hyacinth-flowered, so called from their long, narrow flower spikes. They bloom best in a rather cool, moist soil. Sow seed in the open border, either in spring or fall, preferably the latter, so that germination may take place very early in the spring. As the seedlings grow, thin them to stand 6 to 18 inches apart, according to variety. The varieties are seldom kept separate, as they are guite as pretty and convenient for cutting	
flower spikes. They bloom best in a rather cool, moist soil. Sow seed in the open border, either in spring or	
fall, preferably the latter, so that germination may take	
thin them to stand 6 to 18 inches apart, according to	
variety. The varieties are seldom kept separate, as	
when sown in mixture Some of these are really hardy	
biennials, but, because they bloom the first season, we treat them as hardy annuals. The shades of color cover	
a very wide range. Pkt.

ERYTHRINA Crista-galli (Coral Tree).
This fine greenhouse shrub does well in the garden border in summer; scarlet flowers.
ESCHSCHOLTZIA Commonly called California Poppy. The state
flower of California. This much esteemed hardy annual
is very bright and rich in its pure tints of yellow, orange,
silvery foliage, and produce their large, poppy-like flowers from early spring until frost. They are most effective when grown in beds of considerable size, over
effective when grown in beds of considerable size, over
which the seed may be sown broadcast thinly and lightly raked in. These sowings may be made early in spring or late in autumn for earlier germination, blooming the next spring. Useful as a pot-plant and for cut-flowers.
THORBURNI. Coppery orange; the ef-
fect of a plant in bloom is simply gorgeous; the flowers are larger than those of other
Eschscholtzias, and are borne with equal
profusion; finest of all. (See cut, p. 87.) 63900 10 californica. Rich yellowoz. 30c 63910 5

IMPERIAL JAPANESE MORNING-GLORY

OMOEA (MOONFLOWER. MORNING-Climbers for garden and greenhouse these are the quickest and most luxuriant in growth. Ipomæas grow so easily from annual sowings that it is no longer thought necesfrom annual sowings that it is no longer thought necessary to winter over roots or young-cutting plants under glass. The large, thorny seeds of some varieties should be soaked in hot water before planting. For early flowers sow in hotbeds or pots and boxes under glass, and transplant to rich, deep soil in summer quarters as soon as danger of frost is over, when sowings may also be made in the open ground. Nothing finer for porches trallises are porches, trellises, etc. *These are very hard-seeded, and, in order to hasten germination, a notch should be filed in the seed before planting. NNUAL VARIETIES. From early sowings these begin to bloom about midsummer, and are full of beautiful flowers all the season, often blooming freely until cut down by frost.

Pkt.

Pkt. *bona nox (Good Night, or Evening 5 lutea. A yellow-flowered variety hederacea grandiflora superba. Rich sky-blue flowers with white margins; 15 ft......67230 grandiflora fol. marmoratis, Mixed, Variegated. 67240 IMPERIAL JAPANESE MORNING-GLORY. MIGNONETTE, MACHET

NASTURTIUM

We do not sell less than one ounce of any one kind by weight

A marvelous range of new colors has been developed in this favorite flower which, for three or four months of the season, makes a better display than almost any other plant. No other hardy annual will produce such a lavish profusion of flowers for so long a time with the same small outlay of time and labor The maximum of bloom is produced on thin soils, and never flags through the hottest weather. In soils too rich leaves predominate, and the plants are apt to rot off in wet weather, especially if standing too close.

For the celebrated Lobb's Climbing Varieties, see next page

NOLANA ATRIPLICIFOLIA

PANSY (Viola tricolor; Heartsease)

Our strains have never been excelled

The Pansy is a plant that we all delight to grow in plentiful supply for flowers all the year. For very early outdoor bedding, the seed is sown from August to October, in a coldframe, or in rich, moist garden

beds, from which the plants can be transferred to a cold-frame, setting them 2 to 3 inches apart each way before severe winter weather begins. In spring, three-fourths of them can be lifted out for bedding and the rest left to bloom in the frame. For winter blooming in a frame set the plants about twice as far apart, and thin out half of them in the spring. Cover the blooming plants with sashes, adding a covering of matting or straw in very cold weather. In mild weather, remove the mats and tilt the sashes to admit light, heat and fresh air. In outdoor beds, raised a few inches above the ground, with a mulch of dry leaves and some brush to hold them in place, Pansies will often winter nicely and bloom until midsummer, when a relay of young, vigorous plants should be ready to replace them. Spring sowings should be made early so as to secure good flowers during the early rains. Seed sown in a cool, moist place in June and July, and well tended, will give good flowering plants for fall. If they come into bloom in the heat of the summer, the flowers may be small at first, but, as the weather becomes cooler, they will increase in size and beauty, and make a glorious show in the garden. Through summer heat the flowers are finer in a somewhat shaded place, but in almost any situation good Pansy seed will give fine flowers in spring and fall. Early fall sowings give the finest flowers in spring, and a bed of Pansies is one of the most beautiful sights a garden can show. The higher-priced sorts produce the largest flowers and the most brilliant colors. This should be borne in mind when ordering.

We do not sell less than 1/4 ounce of a kind by weight

DOUBLE LARGE-FLOWERING. Our seed will	
beautiful either for house, garden or conservatory.	
Only a small proportion of the double strains bear double	
produce flowers large, fragrant, elegantly formed and beautiful either for house, garden or conservatory. Only a small proportion of the double strains bear double flowers. The reason of this is the fact that the seed must be selected from single flowers, the double ones not producing seed. The single flowers must be pollinated with pollen from the double ones. Cuttings may be made from double-flowered plants and inserted in light sandy	
ducing seed. The single flowers must be pollinated with	
double nowered planto and incerted in light, bandy	
loam for rooting, thus increasing the percentage of double-flowering plants.

PHASEOLUS multiflorus Papilio (Butter-Pkt.

PHLOX DRUMMONDII (F L A M E FLOWER).

The hardy annual Phloxes are dazzling in effect, particularly so when sown in masses or ribbon beds of contrasting colors. Few flowers are so easy to grow from seed, so pretty and compact in habit, so quick to bloom, or give such a brilliant display of color for so little cost and care. There are few desirable colors beyond their range, and if given good soil and plenty of water, they furnish a long supply of delicate flowers. For pot culture, as trailers, and as an undergrowth for tall, bare-stemmed plants, they are also valuable. The first sowings should be made as soon as the frost is out of the ground in spring, later ones in May, either where the plants are to bloom, or in a seed-bed, as the Phlox transplants readily. In transplanting set the taller kinds about a foot apart; if planted too thickly, they suffer from mildew. Cutting away the flowers and seed-pods makes the plants more bushy and compact, and lengthens their blooming time. Average height, I ft.

GRANDIFLORA. This section has beautiful, round-petaled flowers, larger than in the older sorts; showy and constant, blooming in the greatest profusion from early summer to frost. Our strain is far superior to that Pkt.

ORTIILACA This charming little hard	y an-

PO

among plants of low growth, and, though it flourishes under almost all conditions, hot sun and a light, sandy soil suit it best. Nothing is prettier for beds, edgings, rockwork, etc. As an undergrowth for taller plants it is also valuable. Through the driest, hottest seasons it flourishes amazingly, carpeting the ground with a mat of succulent foliage that, in the forenoon, is hidden by gayest flowers. The seed does not germinate until hot weather, and should be sown late. This plant requires little care and can be transplanted in full flower. Average height, 6 inches.

PORTULACA, continued DOUBLE VARIETIES. UBLE VARIETIES. The flowers are so full and perfect as to resemble tiny roses. Toward the close of the season they will increase in size and beauty. As the full-double flowers do not produce seed, it must be saved from the semi-double flowers growing with the full-doubles. The product of that seed will produce many single flowers. As these bloom earlier, they can be pulled out like weeds. When the full-doubles appear cuttings can be made from them and the bed extended indefinitely with only full-double flowers. Our strains must not be confused with the ordinary cheap seed usually sold.

PRIMULA

CHINENSIS (Chinese Primrose)(gP). Primulas, or Chinese Primroses, stand in the first rank among greenhouse plants, and are fine for winter and spring blooming. They are free-flowering and are especially valuable for cut-flowers and for house and window culture. A cool place suits them best. Sow the seed in light soil, but for final potting a richer soil is necessary, and it should consist of two parts of loam to one each of well-decayed manure and leaf-mold. The plants must be well ventilated, well watered and slightly shaded. Average height, 9 in.

Sembriata alba. White: fringed. 75200.

VENUS' NAVELWORT (Cynoglossum lini- Pkt. blooms all summer; 10 in.

VERBASCUM pannosum......80610 IO

A stately and decorative hardy perennial, with large, white, woolly leaves and splendid spikes of sulphuryellow flowers; fine for backgrounds; 4 to 5 ft.

VERBENA (hhA). In rich soil, single plants of this pretty annual creeper will carpet a space 3 to 4 feet in diameter. For beds, borders, mounds, window-boxes, etc., it is particularly fine, and is frequently used as an undergrowth to tall plants like lilies. Plants raised from seed are cheaper, more vigorous and produce more flowers than those grown from cuttings. For early spring bloom, sow under glass in February, for later flowers, sow in March or April. Soak the seed a few hours in tepid water and sow in boxes filled with light, rich soil; cover one-fourth of an inch deep, press down firmly and water sparingly. When the seedlings are about an inch high, transplant into other boxes. Use a liberal amount of manure in the beds, and set out 10 to 15 inches apart each way in May and in a sunny situation. The plants bloom from early summer until frost.

ORNAMENTAL GRASSES

The Ornamental Grasses are very attractive to use in mixed flower-beds or borders, and for grouping by themselves give fine effects. Many of them, if cut before they are entirely ripe, will be found very useful, when dried, in the formation of winter bouquets, in connection with the "Everlastings."

Not less than one ounce of the cheaper sorts at ounce rate.

GYMNOTHRIX. Curious and ornamental; single speci
mens are of striking effect; 3 ft. Pkt japonica (hA). Long, narrow leaves; bears

GLADIOLI

ALL EXTRA-SELECTED, LARGE BULBS, NO SECOND SIZE Add 6 cts. per dozen, or 50 cts. per 100 for postage

Gladioli are very easily grown. Any good soil suits them. Plant the bulbs as soon as all danger from frost is past, about 3 inches deep and 7 or 8 inches apart. By planting at intervals up to the first of July, these fine flowers can be had in bloom all through the summer and fall—the later flowers being the best. About the end of October, when the leaves begin to wither, the bulbs should be taken up, dried in the open air, and then stored in a dry place, free from frost, for planting next spring. Those marked with an asterisk (*) are used extensively for forcing.

THORBURN'S EXTRA-FINE MIXED HYBRIDS

Containing only finest named sorts in a wide range of colors and markings. 65 cts. per doz., \$4.50 per 100, \$40 per 1,000.

PRIMULINUS Hybrids. Hybrids of a South African species, with many related species and choice garden varieties. Extremely vigorous and healthy growers, blooming in July and August. Grows 3 to 5 feet high, with long spikes of richly colored blooms, varying in color from clear yellow to crimson, the latter with large, soft orange or golden throats. 15 cts. each, \$1.50 per doz., \$10 per 100.

CANNAS, Dwarf, Large-Flowering French

Not less than 6 of a kind at dozen rate, 25 at 100 rate. If wanted by mail, add 15 cts. per dozen for postage

Cannas do well in almost any kind of soil, but they well repay liberal treatment. For the best results they should be planted in good loam that has been well mixed with an abundant supply of well-rotted stable or other manure. The beds should be spaded 2 feet deep, or more, and the soil well pulverized. Water should be applied abundantly at all times, but good drainage is essential.

Cannas are most effective when planted in masses, either alone or in combination with salvia (scarlet sage) and bordered with coleus or other dwarf-growing bedding plants. They are also frequently used with some of the tall-growing ornamental grasses, with which striking combinations can often be secured. They do best in sunny

situations, and should be set out about 2 feet apart each way.

Double Pæonies are too well known to require description. Their present popularity is due to the great im-Double Pæonies are too well known to require description. I near present popularity is due to the great improvement in them in recent years, their easy culture, the handsome appearance of the plant, and the brilliant and striking effect of their massive, finely formed and richly colored flowers. The attention given to them, in Europe and in America, has resulted in the production of many notably fine new varieties. Among hardy, herbaceous perennials, the Chinese Pæonies rank about first for lawn or flower-border, or shrubbery decoration.

Our assortment includes some of the best and most distinct sorts, new and old. There are many kinds, including varieties showing but trifling variations, which we omit.

Lilies are easily grown and require little care. They do best in a light, well-drained soil. Some peat or leaf-mold may be used to advantage. They also prefer partial shade, and the taller sorts must have protection from high winds. L. auratum cannot bear manure, but thrives in ordinary light soil.

20 00

LILIUM LONGIFLORUM

(White Trumpet Lily)

This is among the most beautiful and valuable of garden Lilies. It grows from I to 4 feet high, and bears many trumpet-shaped, sweetly-scented, waxy white flowers. A well-drained, light loam enriched with leaf-mold suits it best.

MIXED JAPAN IRIS FROM A SUPERB COLLECTION

A splendid assortment of extra-size clumps. Home-grown stock. 15 cts. each, \$1.50 per doz., \$11 per 100.

SUPERB COLLECTION OF LARGE-FLOWERED SORTS

We are importing from Japan a large supply of the following twenty of the best of these magnificent Irises, which are remarkable for the beauty of their colorings and stateliness of habit. Some of them send up ten to twelve spikes, 3 feet high, each bearing two to four enormous blossoms, 8 to 10 inches across. They are most valuable for cut-flowers and table decoration—as handsome as orchids. Supply water liberally when growing. Cut in the early morning or after sunset. The descriptions given are those furnished us by the growers in Japan.

25 cts. each, \$2.50 per doz., \$18 per 100. The following may be ordered by number

primrose blotches; standards wine-Striking.

25 cts. each, \$2.50 per doz., \$18 per 100. The following 13 Boteki-no-Koe. Pure white, heavily veined lavender, with pale color, lighter toward edges, stigmas lavender. Three large petals. 26 Date-dogu. Rich claret-red, yellow blotches. Three petals. 89 Fuyoho. Large; pure white, yellow blotches. Three petals. 31 Gei-Sho-Ui. Claret-red, veined white; standards shaded lavender, darker toward the edges, yellow blotches. 4 Ho-o-jo (Ho-o-castle). Ruby-crimson, primrose blotches; standards white and lavender. 37 Katsuraotoko. White, veined lavender; standards white, suffused with lavender, darker toward the edges. Six petals. 15 Momiji-no-Taki. Ruby-red, yellow blotches; standards white, spotted toward edges pale wine-color. Six petals. 30 Noboro-Ryu. Intense Tyrian blue, with yellow blotches; standards white, edged violet. 9 Ran. Royal purple, edged lavender, with large primrose blotches; standards wine-red, white at base. Six large petals. 34 Sassa-no-Koe. White, veined wine-red and blotched yellow; standards lavender, running to purple at edges. Three petals. standards lavender, running to purple at edges. Three petals.

standards lavender, running to purple at edges. Three petals.

20 Senjo-To. Light wine-color, spotted and shaded to dark red toward the edges of the petals, suffused with white, yellow blotches; standards shading to purple.

40 Shiguremoniji. Blush-pink, darker toward edges, splashed wine-red; stigmas lavender, primrose blotches. Three petals.

21 Shikainami. Light blue, shading to dark blue edges, white-veined, yellow blotches; standards shaded lavender, with dark edges. Particular y handsome. Six petals.

6 Shippo (Cloisonné). Rich Tyrian blue, edged purple and veined white, yellow blotches; standards white and wine-color.

14 Shiraga. Deep purple, heavily veined white; standards lavender, darker toward edges, yellow blotches. Six large petals.

17 Suibijin. Claret-red, darker toward edges; standards white, veined and edged wine-color; stigmas wine-color. Three petals. veined and edged wine-color; stigmas wine-color. Three petals. 44 Ujigawa. Rich, vinous purple; standards blush-pink; stigmas

lavender, canary-yellow blotches. Three immense petals.

50 Ushio-no-Iro. Violet, veined white; standards white, edged sky-blue, yellow blotches. Seven or eight petals.

7 Yamato-Nishiki. Pale lavender, running to purple on outside of petals, blotched and flaked dark purple, large prim-

rose blotches. Immense flower. Three petals.

8 Yodokuruma. Pale wine-color, veined darker, large, orange blotches; standards very erect. Gigantic blooms. Three petals.

GERMAN IRIS (Iris Germanica)

Will thrive in almost any good garden soil, except one that is wet. Fine Mixed. 75 cts. per doz., \$5 per 100.

JAPAN IRIS

AMARYLLIS

The Amaryllis produces, under the simplest conditions, one to three spikes 2 or more feet high, crowned with from two to six large and beautiful, trumpet-shaped blooms lasting long in good condition. They should be planted as soon as received, in pots an inch or so larger than the diameter of the bulb.

The most suitable soil is good loam, with one-fourth part of leaf-mold or pulverized manure, and some sand. Good drainage is very important. The growing season is from early spring until September. Manure-water during

this time is essential.

BEGONIA CRISPA (Single Fringed Begonias). These comparatively new Begonias have beautifully shaped, gracefully frilled and crested flowers, borne above the foliage on long and erect stems. An exceedingly fine strain. RED, ROSE, WHITE, YELLOW, SALMON and ORANGE. 75 cts. per doz., \$6 per 100.

CRINUMS

The most suitable soil is a compost of turfy loam, cow-manure and sand. They should be grown in large pots or tubs, about three-fourths of the bulb being out of the soil. In late fall, remove to a coolhouse and allow to rest till new leaves begin to appear in February. If placed outside when warm weather begins, they will flower through the summer, making splendid lawn or veranda plants.

GLOXINIAS

Beautiful greenhouse plants, remarkable for the intensity and variety of their colorings, and the exquisite manner in which they are often blotched, mottled, penciled and blended. They thrive best in a soil composed of leaf-mold and peat, in equal parts, with a little sand added. When growing give plenty of water, but it should always be tepid.

Pulverized Sheep Manure

(Sheepshead Brand)

A rich, pure, natural manure. Excellent as a top-dressing for lawns. Its effect is immediate and lasting. There is nothing better for mixing with the soil for greenhouse plants—one part manure to six parts soil. It is recommended for the vegetable-garden, promoting a steady and rapid growth. It makes a rich and safe liquid manure—one pound to five gallons of water.

o. 6. Large size. Has one spray rose and gooseneck a n g l e j o i n t, turning in all directions, for washing the under surface of the leaves of plants and flowers, cleansing them from insects, etc. Length of barrel, 18 in., diam. 1½ in. \$8 each.

Spray Pump, Bucket

Being made of brass, it is not affected by the arsenites used for spraying. Easily operated; throws a solid stream 50 feet. It is provided with a combination nozzle, and also with a sprinkler for flowers. For spraying large trees, an 8-foot pipe extension is supplied for 60 cents extra. This pump is also valuable for washing windows. \$3.75.

Operates on the compressed-air principle and throws a continuous

spray. Interchangeable brass nozzle—one to throw the spray straight ahead, and one to spray up or down. Capacity, one quart.

Each Tin.....\$1 00 Brass.....\$1 50

"Pomona" Spray Pump

Of large capacity and exceptionally powerful. It is easily operated by one person when necessary, but is especially built for spraying with two leads of hose. The air-chamber is rather large, and enough air is stored up for a continuous spray for some time. Plunger, valves and all working parts are made of very good-quality brass. It

"POMONA" SPRAY PUMP, continued

can be quickly inserted or removed from the barrel. Its paddle agitator is far superior to the old returndischarge method of stirring. Adjustable to different-sized barrels.

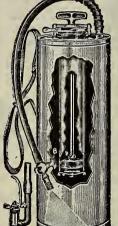

Pump only, with agitator, \$15; fitted to barrel, \$18.

Outfit C. Pump, agitator, one lead of discharge hose and spray nozzle, \$18; fitted to barrel, \$21. Outfit D. Pump, agitator, two leads of discharge hose and two spray nozzles, \$20; fitted to barrel, \$23.

"Fruitall" Spray Pump

Same as Pomona, but smaller. Pump with agitator and one lead of 15 feet of ½-in. discharge hose, with spray nozzle, \$10; fitted to barrel, \$13.

Vaporizing Spray Pump, Hand

"Auto-Spray" Spray Pump

A self-operating Sprayer of simple construction, durable, easy to carry and to work. Made of galvanized iron or solid brass, with 4-ply rubber hose For spraying trees, cleaning windows, etc. A perfect pump.

With brass tank and stop-cock nozzle, hose and fittings, \$7.50.

With galvanized iron tank and stop-cock nozzle, hose and fittings, \$5.

Either kind of tank fitted with Auto-Pop nozzle, in-

stead of stop-cock nozzle, 50 cts. extra.

Brass extension pipes, 2 feet long, 45 cts.

Auto-Pop nozzle, if sold alone, \$1.50.

Knapsack Spray Pump FOR VINEYARD, ORCHARD AND FIELD SERVICE

Made entirely of brass and copper, with ball valves and metal plunger all easily accessible.

The discharge is at the bottom, and the pump can be entirely drained of the liquid. It should be carried on the back with the straps crossed in front. The reservoir is made of heavy copper and will hold about five gallons. Complete with 3½ feet of 3½-inch discharge hose, Vermorel nozzle and lance for degorger, \$13.50.

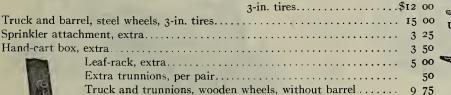

Water-Barrel, Truck and Barrel

CAN BE MADE INTO SPRINKLER, LEAF-RACK
AND HAND-CART

The barrel is easily disconnected from the truck, either while full or empty. The following extra attachments can be furnished if required: (1) Box with trunnions and spring catch, forming a dumping hand-cart.

(2) Sprinkler for watering walks and lawns. (3) Leaf-rack.

Truck and barrel, wooden wheels,

Used as a Hand-Cart

Handy Grass Clipper and Lawn Trimmer

GREAT TIME-SAVER, INDISPENSABLE ON EVERY WELL-KEPT LAWN, MADE OF BEST MATERIALS THROUGHOUT

An implement designed to fill a long-felt want. It cuts a swath 5 inches wide and will pick the last blade of grass from around trees and shrubbery. Takes the place of the old-fashioned, unsatisfactory hand grass shears and entirely does away with the necessity of kneeling or stooping. It is self-sharpening and requires no attention except occasional oiling and adjusting. Price, \$2.50 each.

Handy Grass Clipper and Lawn Trimmer

The "Velvetlawn" Grass Seeder

Truck and trunnions, steel wheels, without barrel...... 12 75

18 inches wide

The use of a machine in the seeding of new lawns or grass plots, the re-seeding of old lawns, the drilling of grass seeds into putting-greens, and the renewing of grass plots every month or so has proved a decided success wherever it has been tried. The machine to do this work is the "Velvetlawn" Grass Seeder.

The cutting action of the discs relieves old sod of root-bound conditions by cultivating around the roots.

Each disc automatically conforms to inequalities in the ground.

The discs do not tear the soil; they cut it.

The operator can drill any amount of seed desired.

The "Velvetlawn" Grass Seeder puts the seed into the soil where the birds, wind and rain cannot get at it.

Every seed-trench contains an equal quantity.

Every feed is a force feed and sows the same amount.

"Velvetlawn" Grass Seeders are equipped with adjustable handle, thus insuring ease of operation for any height of man.

All of the seed being planted at an even depth in the soil, the plants must all come up at the same time, and make uniform growth. Price, \$15, net cash.

"Velvetlawn" Grass Seeder

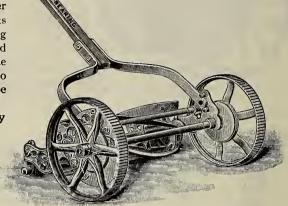

The Thorburn Century Ball-Bearing Lawn Mower

Thorburn's Century Ball-Bearing Lawn Mower is a marvel of simplicity, as one screw adjusts both bearings. It has a simple, self-adjusting device, which keeps the bearing properly adjusted for a long time, and a double interchangeable ratchet. By shifting handle bails from the front to the rear lugs on the side frame, the Mower can be made to cut terraces and steep banks.

While cheaper mowers are sold all over, they will be found far dearer in the end. It pays to get a good Mower.

NET PRICES	Each
14-inch cut	.\$8 50
16-inch cut	
18-inch cut	.10 50
20-inch cut	.11 50

Manufactured expressly for us, and is, in every respect, the BEST LAWN MOWER ever made.

Chain Roller or Golf Mower

This mower is made to meet the demand for a machine that will more perfectly cut borders, verges, etc., and yet retain all the other features necessary in a Mower for general work. Its great advantage is the substitution of a bicycle chain for the gears generally used in this style of Mower. This reduces the friction to a minimum. The machine with six blades

is highly recommended for work on putting-greens.

Improved Horse Lawn Mower

This well-known standard Mower has side draft attachment, to enable the horse to walk on the cut grass only, and caster-rollers which will not mark the lawn. Evenness of cut is assured by an adjustment which raises or lowers the two sides at the same time by means of a simple lever movement; the same lever serves the purpose of raising the knives from the ground when driving over gravel walks or roads.

Clark's A5 Double-Action Cutaway Harrow

This Harrow will cut and reduce the toughest sod to plantfood without the aid of a plow. It will cut from 28 to 30 acres or will double-cut 15 acres in a day. It can be set so as to move the earth but little, or at so great an angle as to move all the earth one foot. It keeps the surface true and the machine runs true in line of draft. Price, \$33 net, f. o. b. factory (Conn.).

Cutaway Grading or Smoothing and Leveling Harrow

With this tool any field can be made smooth and the soil pulverized fine enough for a flower-bed. Will smooth an acre in twenty minutes. It is adjustable with a lever, by which the entire action is controlled by the driver, and he can remove at will all the earth possible for the team to haul, taking it from hills or uneven places and putting it into hollows, to level up field. For one horse (6 feet wide), \$13.50. For two horses (8 feet wide), \$15.50, f. o. b. factory (Conn.).

Coldwell's Combination Roller and Motor Lawn Mower

This machine cuts a swath 40 inches wide, is equipped with a 2-horse-power motor capable of propelling the Mower through almost any height of lawn grass, and up grades as steep as 25 per cent. Price \$475.

In our list of Horticultural Implements and Garden Requisites, beginning on page 132, will be found many things which will add to the pleasure of gardening
